Manual
Web Smart Switch

Ver. 1.00

WIRED

Table of Contents

About This Guide

This guide provides instructions to install the D-Link Fast Ethernet Web Smart Switch DES-1210-28/52, how to use the SmartConsole Utility, and to configure Web-based Management step-by-step.

> **Note:** The model you have purchased may appear slightly different from the illustrations shown in the document. Refer to the Product Instruction and Technical Specification sections for detailed information about your switch, its components, network connections, and technical specifications.

This guide is mainly divided into four parts:

1.   Hardware Installation: Step-by-step hardware installation procedures.
2.   Getting Started: A startup guide for basic switch installation and settings.
3.   Smart Console Utility: An introduction to the central management system.
4.   Configuration: Information about the function descriptions and configuration settings.

Terms/Usage

In this guide, the term "Switch" (first letter capitalized) refers to the Smart Switch, and "switch" (first letter lower case) refers to other Ethernet switches. Some technologies refer to terms "switch", "bridge" and "switching hubs" interchangeably, and both are commonly accepted for Ethernet switches.

> A **NOTE** indicates important information that helps a better use of the device.

> A **CAUTION** indicates potential property damage or personal injury.

Copyright and Trademarks

1 *Product Introduction*

Thank you and congratulations on your purchase of D-Link Web Smart Switch Products.

D-Link's next generation Web Smart Ethernet switch series blends plug-and-play simplicity with exceptional value and reliability for small and medium-sized business (SMB) networking. All models are housed in a new style rack-mount metal case with easy-to-view front panel diagnostic LEDs, and provides advance features including two combo 1000BASE-T/SFP and two additional Gigabit uplinks, network security, traffic segmentation, QoS and versatile management.

Choices of 24 and 48 ports. Two port densities are available for selection: 24 Ethernet ports and 48 Ethernet ports. Supporting auto-detection of MDI/MDIX, these switches bring inexpensive and easy Ethernet connection to the desktops. Each switch provides 4 Gigabit uplinks connection to a Gigabit backbone or servers. 2 of the Gigabit ports are combo with the SFP which support both 1000M and 100M fiber connection.

Extensive Layer 2 Features. Implemented as complete L2 devices, these switches include functions such as IGMP snooping, port mirroring, Spanning Tree, 802.3ad LACP and Loopback Detection to enhance performance and network resiliency.

Traffic Segmentation and QoS. The switches support 802.1Q VLAN standard tagging to enhance network security and performance. The switches also support 802.1p priority queues, enabling users to run bandwidth-sensitive applications such as streaming multimedia by prioritizing that traffic in network. These functions allow switches to work seamlessly with VLAN and 802.1p traffic in the network. Auto Voice VLAN will automatically place the voice traffic from IP phone to an assigned VLAN with higher priority, so it can be separated from normal data traffic. Asymmetric VLAN is implemented in these switches for a more efficient use of shared resources such as server or gateway devices.

Network Security. D-Link's innovative Safeguard Engine function protects the switches against traffic flooding caused by virus attacks. Additional features like 802.1X port-based authentication provides access control of the network with external RADIUS servers. ACL is a powerful tool to screen unwanted IP or MAC traffic. Storm Control can help to keep the network from being overwhelmed by abnormal traffic. Port Security is another simple but useful authentication method to maintain the network device integrity.

Versatile Management. The new generation of D-Link Web Smart Switches provides growing businesses simple and easy management of their network using an intuitive SmartConsole utility or a Web-Based management interface that allows administrators to remotely control their network down to the port level. The SmartConsole easily allows customers to discover multiple D-Link web smart switches with the same L2 network segment connected to user's local PC. With this utility, users do not need to change the IP address of PC and also provides easy initial setting of smart switches. The switches within the same L2 network segment connected to user's local PC are displayed on the screen for instant access. It allows extensive switch configuration setting, and basic configuration of discovered devices such as a password change or firmware upgrade.

Users can also access the switch via TELNET. Some basic tasks can be performed such as changing the Switch IP address, resetting the settings to factory defaults, setting the administrator password, rebooting the Switch, or upgrading the Switch firmware by using the Command Line Interface (CLI).

In addition, users can utilize the SNMP MIB (*Management Information Base*) to poll the switches for information about the status, or send out traps of abnormal events. SNMP support allows users to integrate the switches with other third-party devices for management in an SNMP-enabled environment. D-Link Web Smart Switches also come with the D-View plug-in module that works with D-View 6 SNMP Management Software and provides easy-to-use graphic interface and facilitates the operation efficiency.

DES-1210-28

24-Port 10/100Mpbs with 4-Port 10/100/1000Mbps Copper and 2 Combo SFP Web Smart Switch

Front Panel
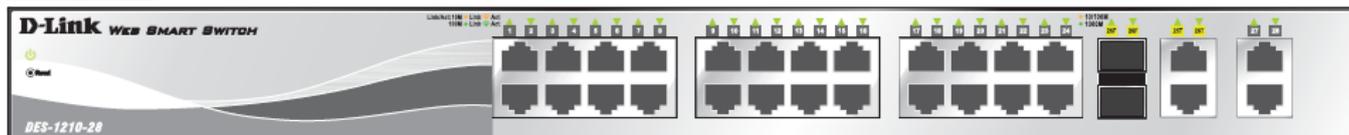

Figure 1 – DES-1210-28 Front Panel

Power LED ⏻: The Power LED lights up when the Switch is connected to a power source.

Port Link/Act/Speed LED (1-24): The Link/Act/Speed LED flashes which indicates a network link through the corresponding port. Blinking indicates that the Switch is either sending or receiving data to the port. When a port has amber light indicates that port is running on 10M. When it has a green light it is running on 100M.

Port Link/Act/Speed LED (25F, 26F, 25T, 26T, 27, 28): The Link/Act/Speed LED flashes which indicates a network link through the corresponding port. Blinking indicates that the Switch is either sending or receiving data to the port. When a port has amber light indicates that port is running on 10M or 100M. When it has a green light it is running on 1000M.

> **NOTE:** On DES-1210-28, the MiniGBIC ports are shared with normal RJ-45 ports 25 and 26. When MiniGBIC port is used, the RJ-45 port cannot be used.

Reset: By pressing the Reset button the Switch will change back to the default configuration and all changes will be lost.

Rear Panel

Figure 2 – DES-1210-28 Rear Panel

Power: The power port is where to connect the AC power cord.

DES-1210-52

48-Port 10/100Mpbs Web Smart Switch with 4-Port 10/100/1000Mbps and 2 Combo SFPs

Front Panel

Figure 3 – DES-1210-52 Front Panel

Power LED ⏻: The Power LED lights up when the Switch is connected to a power source.

Port Link/Act/Speed LED (1-48): The Link/Act/Speed LED flashes which indicates a network link through the corresponding port. Blinking indicates that the Switch is either sending or receiving data to the port. When a port has amber light indicates that port is running on 10M. When it has a green light it is running on 100M.

Port Link/Act/Speed LED (49F, 50F, 49T, 50T, 51, 52): The Link/Act/Speed LED flashes which indicates a network link through the corresponding port. Blinking indicates that the Switch is either sending or receiving

data to the port. When a port has amber light indicates that port is running on 10M or 100M. When it has a green light it is running on 1000M.

Reset: Press the reset button to reset the Switch back to the default settings. All previous changes will be lost.

> **NOTE:** On the DES-1210-52, the MiniGBIC ports are shared with normal RJ-45 ports 49 and 50. When the MiniGBIC port is used, the RJ-45 port cannot be used.

Rear Panel

Figure 4 – DES-1210-52 Rear Panel

Power: Connect the supplied AC power cable to this port.

2 *Hardware Installation*

This chapter provides unpacking and installation information for the D-Link Web-Smart Switch.

Step 1: Unpacking

Open the shipping carton and carefully unpack its contents. Please consult the packing list located in the User Manual to make sure all items are present and undamaged. If any item is missing or damaged, please contact your local D-Link reseller for replacement.

> One D-Link Web-Smart Switch
> One AC power cord
> Four rubber feet
> Screws and two mounting brackets
> One Multi-lingual Getting Started Guide
> One CD with User Manual, SmartConsole Utility program, and D-View Module

If any item is found missing or damaged, please contact the local reseller for replacement.

Step 2: Switch Installation

For safe switch installation and operation, it is recommended that you:

> Visually inspect the power cord to see that it is secured fully to the AC power connector.
> Make sure that there is proper heat dissipation and adequate ventilation around the switch.
> Do not place heavy objects on the switch.

Desktop or Shelf Installation

When installing the switch on a desktop or shelf, the rubber feet included with the device must be attached on the bottom at each corner of the device's base. Allow enough ventilation space between the device and the objects around it.
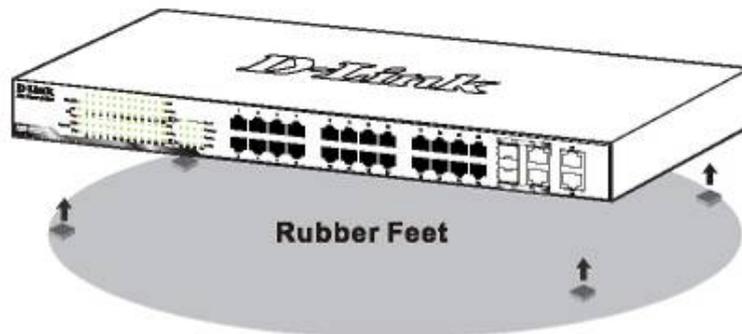

Figure 5 – Attach the adhesive rubber pads to the bottom

Rack Installation

The switch can be mounted in an EIA standard size 19-inch rack, which can be placed in a wiring closet with other equipment. To install, attach the mounting brackets to the switch's side panels (one on each side) and secure them with the screws provided (please note that these brackets are not designed for palm size switches).

Figure 6 – Attach the mounting brackets to the Switch

Then, use the screws provided with the equipment rack to mount the switch in the rack.
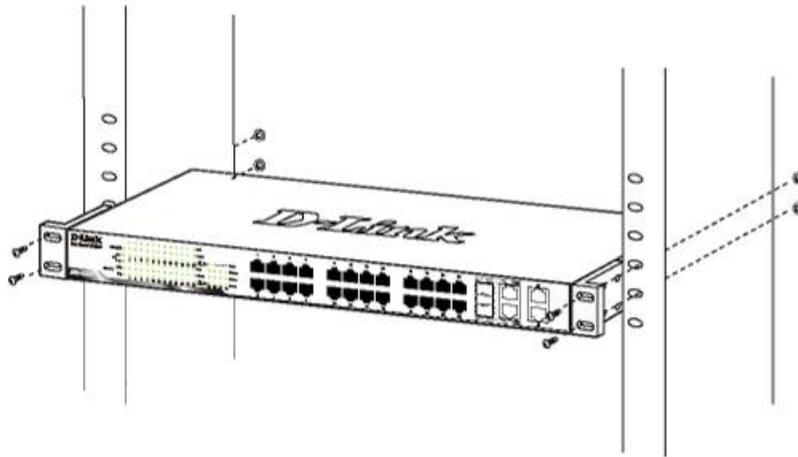

Figure 7 – Mount the Switch in the rack or chassis

Please be aware of following safety Instructions when installing:

A) Elevated Operating Ambient - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature (Tma) specified by the manufacturer.

B) Reduced Air Flow - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

C) Mechanical Loading - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

D) Circuit Overloading - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

E) Reliable Earthing - Reliable earthing of rack-mounted equipment should be maintained. Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips)."

Step 3 – Plugging in the AC Power Cord

Users may now connect the AC power cord into the rear of the switch and to an electrical outlet (preferably one that is grounded and surge protected).
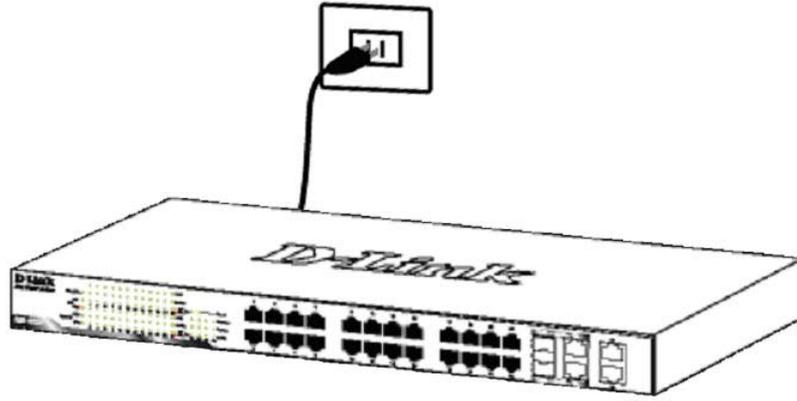

Figure 8 –Plugging the switch into an outlet

Power Failure

As a precaution, the switch should be unplugged in case of power failure. When power is resumed, plug the switch back in.

3 *Getting Started*

This chapter introduces the management interface of D-Link Web-Smart Switch.

Management Options

The D-Link Web Smart Switch can be managed through any port on the device by using the Web-based Management or through any PC using the SmartConsole Utility.

Each switch must be assigned its own IP Address, which is used for communication with Web-Based Management or a SNMP network manager. The PC should have an IP address in the same range as the switch. Each switch can allow up to four users to access to the Web-Based Management concurrently.

However, if you want to manage multiple D-Link Web Smart Switches, the SmartConsole Utility is a more convenient choice. By using the SmartConsole Utility, you do not need to change the IP address of your PC and it is easier to initialize multiple Smart Switches.

Please refer to the following installation instructions for the Web-based Management and the SmartConsole Utility.

Using Web-based Management

After a successful physical installation, you can configure the Switch, monitor the network status, and display statistics using a web browser.

Supported Web Browsers

The embedded Web-based Management currently supports the following web browsers:

- Internet Explorer 6 or higher
- Netscape 8 or higher
- Mozilla
- Firefox 1.5/2.0 or higher

Connecting to the Switch

You will need the following equipment to begin the web configuration of your device:

1. A PC with a RJ-45 Ethernet connection
2. A standard Ethernet cable

Connect the Ethernet cable to any of the ports on the front panel of the switch and to the Ethernet port on the PC.
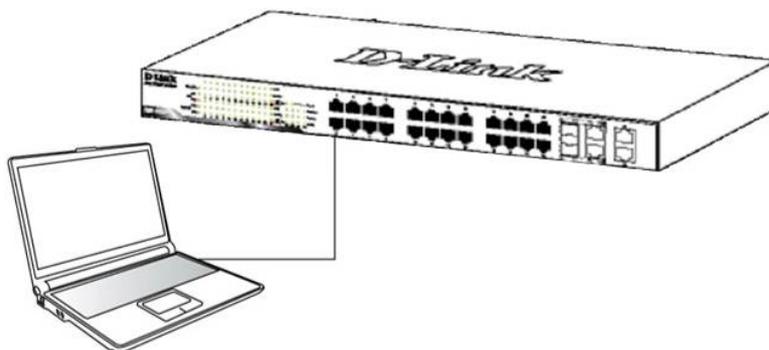

Figure 9 –Connected Ethernet cable

Login Web-based Management

In order to login and configure the switch via an Ethernet connection, the PC must have an IP address in the same subnet as the switch. For example, if the switch has an IP address of **10.90.90.90**, the PC should have an IP address of **10.x.y.z** (where x/y is a number between 0 ~ 254 and z is a number between 1 ~ 254), and a subnet mask of **255.0.0.0**. There are two ways to launch the Web-based Management, you may either click the Web Access button at the top of the SmartConsole Utility or open the web browser and enter **10.90.90.90** (the factory-default IP address) in the address bar. Then press <Enter>.

Figure 10 –Enter the IP address 10.90.90.90 in the web browser

> **NOTE:** The switch's factory default IP address is 10.90.90.90 with a subnet mask of 255.0.0.0 and a default gateway of 0.0.0.0.

The web configuration can also be accessed through the SmartConsole Utility. Open the SmartConsole Utility and double-click the switch as it appears in the Monitor List. This will automatically load the web configuration in your web browser.

When the following logon dialog box appears, enter the password then click **OK**. The default password is **admin**.

Figure 11 – Logon Dialog Box

Smart Wizard

After a successful login, the Smart Wizard will guide you through essential settings of the D-Link Web Smart Switch. Please refer to Smart Wizard Configuration section for details.

Web-based Management

By clicking the **Exit** button in Smart Wizard, you will enter the Web-based Management interface. Please refer to Chapter 5 Configuration for detailed instructions.

SmartConsole Utility

The SmartConsole Utility included in the installation CD is a program for discovering D-Link Smart Switches within the same L2 network segment connected to your PC. This tool is only for computers running Windows 2000, Windows XP, or Windows Vista x64/86 operating systems. There are two options for the installation of the SmartConsole Utility; one is through the autorun program on the installation CD and the other is manual installation.

> **NOTE:** Please be sure to uninstall any existing SmartConsole Utility from your PC before installing the latest SmartConsole Utility.

Option 1: Follow these steps to install the SmartConsole Utility via the autorun program on the installation CD.

1.   Insert the Utility CD into your CD-Rom/DVD-Rom Drive.
2.   The autorun program will appear automatically.
3.   Click on the "Install SmartConsole Utility" button and an installation wizard will guide you through the process.
4.   After successfully installing the SmartConsole Utility, you can open the utility by clicking Start > Programs > D-Link SmartConsole Utility.
5.   Connect the Smart Switch to the same L2 network segment of your PC and use the SmartConsole Utility to discover the Smart Switches.

Option 2: Follow these steps to install the SmartConsole Utility manually.

1.   Insert the Utility CD into your CD-Rom/DVD-Rom Drive.
2.   From the Start menu on the Windows desktop, click Run.
3.   In the Run dialog box, type D:\D-Link SmartConsole Utility\setup.exe (where D:\ represents the drive letter of your CD-Rom or DVD-Rom) and click OK.
4.   Follow the on-screen instructions to install the utility.
5.   Upon completion, go to Start > Programs > D-Link SmartConsole Utility and open the SmartConsole Utility.
6.   Connect the Smart Switch to the same L2 network segment of your PC and use the SmartConsole Utility to discover the Smart Switches.

For detailed explanations of SmartConsole's functions, please refer to Chapter 4 SmartConsole Utility

4 *SmartConsole Utility*

The D-Link SmartConsole Utility allows the administrator to quickly discover all D-Link smart switches which are in the same domain of the PC, collect traps and log messages, and quick access to basic configurations of the switch.

The SmartConsole Utility consists of three parts, **Device Configurations** at the top, **Device List** as the main body, and **SmartConsole Settings** at the left.

Figure 12 – SmartConsole Utility

SmartConsole Settings

The SmartConsole Settings at the left has five icons, **Utility Settings**, **Log**, **Trap**, **File**, and **Help**.

Utility Settings

Click this icon to launch the Utility Settings window. **Refresh time** refreshes the devices which were selected as monitored device in the Device List. Choices include **15 secs, 30 secs, 1mins, 2mins,** and **5 mins** for selecting the monitoring time intervals. **Utility Group Interval** establishes the intervals (in seconds) that the Switch will be discovered in the SmartConsole Device List.

Figure 13 – SmartConsole Utility Settings

NOTE: If the Group Interval is set to 0, IGMP Snooping must be disabled in the Switch or the

Web-Smart Switch will not be discovered.

Log

Click this icon to launch the Log window. Click **View Log** to show the events of the SmartConsole Utility and the device. **Date/Time** indicates when the message was received, **IP** denotes where it comes from and **Status** shows the content of this log message. Click **Clear** Log to clear all log entries. Click **OK** to exit.

Figure 14 – SmartConsole Log

Trap

Click this icon to launch the Trap window. Click **View Trap** to show the events of the SmartConsole Utility and the device. **Date/Time** indicates when the trap message was received, **IP** denotes where it comes from and **Status** shows the content of this trap message. Click **Clear Trap** to clear all entries. Click **OK** to exit

Figure 15 – SmartConsole Trap

The trap icon in the SmartConsole Settings will change while receiving new trap messages. Please see below for detailed description.

Icon	Description
	No new traps
	New traps was received

File

By clicking on this icon you will see below options:

Figure 16 – SmartConsole File

Monitor Save: Records the setting of the Device List as default for the next time the SmartConsole Utility is used.

Monitor Save As: Records the setting of the Device List in an appointed filename and file path.

Monitor Load: Manually load a Device List setting file.

Help

Click this icon to launch the SmartConsole Info window.
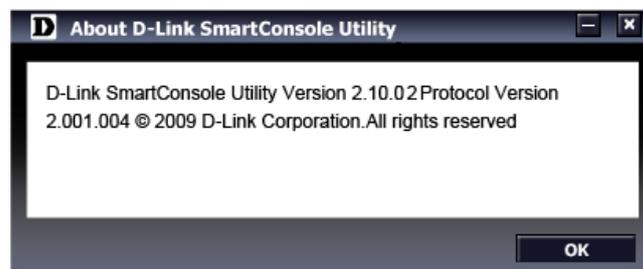

Figure 17 – SmartConsole Help

Device Configuration

The Device Configuration in the SmartConsole Utility has five icons:

Device Settings

Device Password Manager

Multi Firmware Upgrade

DHCP Refresh

Web Access

and the ➕ , ➖ , **Q Discovery** device buttons for the Device List.

Device Settings

Select a switch from the Device List. Click on this icon to launch the Device Settings window. Here you can configure the Product Name, IP Address, Gateway, Subnet Mask, System Name, Location, Trap Host IP, Switch Group Interval, and DHCP Client Setting of the Switch.

To apply the configuration, insert the correct device password in the Confirm Password box and then click **OK**
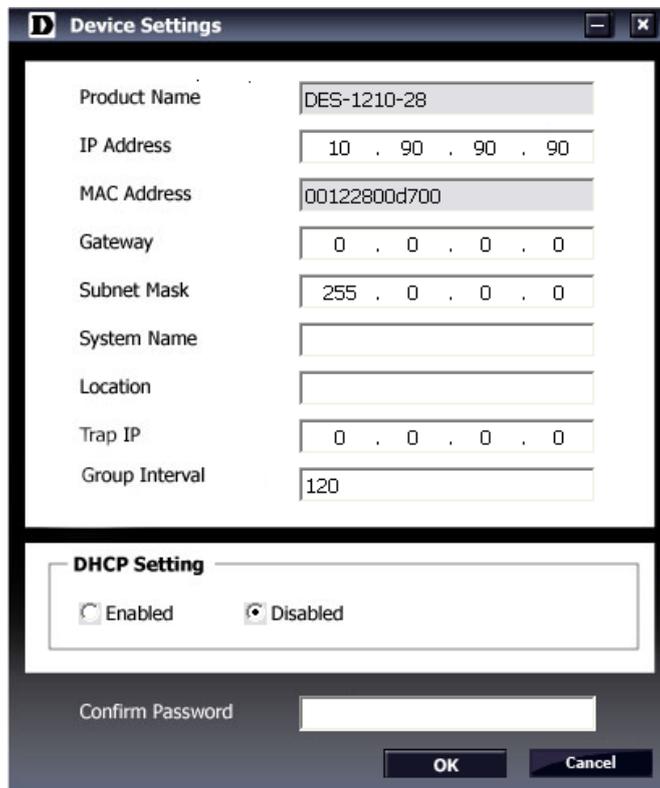

Figure 18 – SmartConsole Device Settings

Device Password Manager

Select a switch from the Device List. Click on this icon to launch the Device Password Manager window. Here you can enter a new password and confirm it.

Figure 19 – SmartConsole Device Password Manager

Multi Firmware Upgrade

Select one or many switches of same model name from the Device List. Click on this icon to launch the Firmware Upgrade window. Specify the Firmware Path (or Browse for one) that you are going to use. Input the correct password of device, and then click **Upgrade.** The state will show "OK" after completion, and "Fail" is firmware upgrade fails or cannot be completed for any reason.

Index	Product Name	IP Address	MAC Address	Firmware Version	State
1	DES-1210-52	10.90.90.90	001252000...	1.00.005	
2	DES-1210-52	172.21.45.59	00ace84788ff	1.00.005	
3	DES-1210-52	172.21.45.95	001252001...	1.00.005	
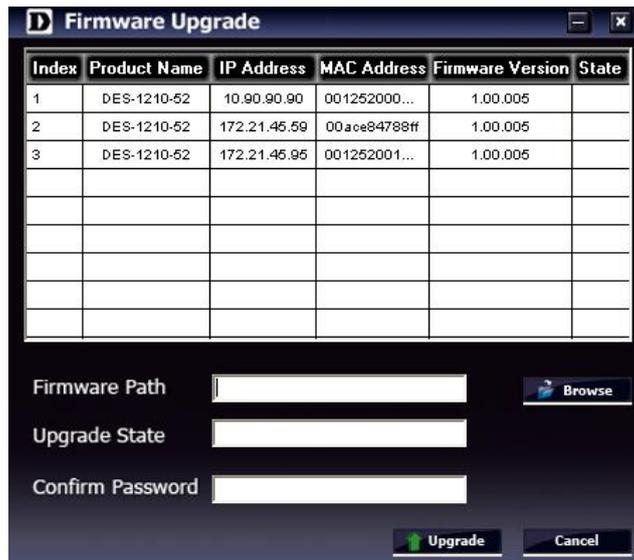

Figure 20 – Firmware Upgrade

⚠ **CAUTION:** Do not disconnect the PC or remove the power cord from device until upgrade completes. The software may be corrupted because the incomplete firmware upgrade.

DHCP Refresh:

If a DHCP-client enabled switch in the Device List shows the default IP is still used, it means the device did not receive an IP address from the DHCP server successfully. Select that switch and click the DHCP refresh icon. Enter the correct Device Password and then **click OK.** The device will renew the IP address from the DHCP server.

Figure 21 – DHCP Refresh

Web Access

Select a switch from the Device List. Click this icon to launch your internet browser (eg. The Internet Explorer). Here you can configure the Switch through the Web-based Management utility. You may also get into the Web-based Management by double-clicking the device in the device list.

Add(+), Delete(-) and Discover the device

Click the **Discovery** button to display all the Web-Smart devices located in the same domain with the management PC.

Click the **+** and insert a device IP address to add a device into Discover List, or select a device and click the **–** button to remove it.

Figure 22 – SmartConsole Add device

Figure 23 – SmartConsole Delete device

Device List

This list displays all discovered Web-Smart devices on the network.

Monitor	IP Address	MAC Address	Protocol Version	Product Name	System Name	
✔	10.90.90.90	00122800d700	2.001.004	DES-1210-28		

Figure 24 – SmartConsole Device List

Definitions of the Device List features:

Monitor: Check the Monitor box and the SmartConsole will collect the trap and log data from the device. The ▢ in the monitor means the device was discovered by SmartConsole. Click the icon to have the device keep updating the information such as system log or trap to the SmartConsole Utility. The icon will become ✔.

When the device was detected as not reachable, the icon will change to 🚫. Please check if the power or the cable of this device is disconnected.

IP Address: Displays the current IP addresses of devices.

MAC Address: Displays the device MAC Addresses.

Protocol version: Displays the software version of the Utility.

Product Name: Displays the device product name.

System Name: Displays the appointed device system name.

DHCP: Specify if the device gets the IP address from a DHCP server.

Location: Displays where the appointed device location.

Trap IP: Displays the IP address of host where the Trap information will be sent to.

Subnet Mask: Displays the Subnet Mask setting of the device.

Gateway: Displays the Gateway setting of the device.

Device Group Interval: Displays the intervals (in seconds) that the Switch will be discovered in the SmartConsole Device List

Firmware version: Displays the current Firmware version of this device.

LLDP: Displays the LLDP (Link Layer Discovery Protocol*)* status of the device.

SNMP: Displays the SNMP status of the device.

> **NOTE:** If the devices marked as red in the device list, it means the devices require to upgrade firmware again.

5 *Configuration*

The features and functions of the D-Link Web Smart Switch can be configured for optimum use through the Web-based Management Utility.

Smart Wizard Configuration

After a successful login, the Smart Wizard will guide you through essential settings of the D-Link Web Smart Switch. If you do not plan to change anything, click **Exit** to leave the Wizard and enter the Web Interface. You can also skip it by clicking **Don't show Smart Wizard next time** for logon the Web-based Management next time.

Password Settings

Password setting allows you to change the login password of the device. Type the desired new password in the **Switch Password** box and again in the **Confirm Switch Password,** then click the **Apply** button to make it effective.

Figure 25 – Configure Password in Smart Wizard

SNMP Settings

The SNMP Setting allows you to quickly enable/disable the SNMP function and configure the SNMP community name. For the complete SNMP function, please check "Setup Menu > System > SNMP Settings" in the Web Interface. The default SNMP Setting is Disabled. Click **Enabled,** enter Community names, and then click **Apply** to make it effective.

Read_Only Community: Read-only privilege allows authorized management stations to retrieve MIB objects values. Default Community name is **public**.

Read_Write Community Read/write privilege allows authorized management stations to retrieve and modify MIB object values. Default Community name is **private**.
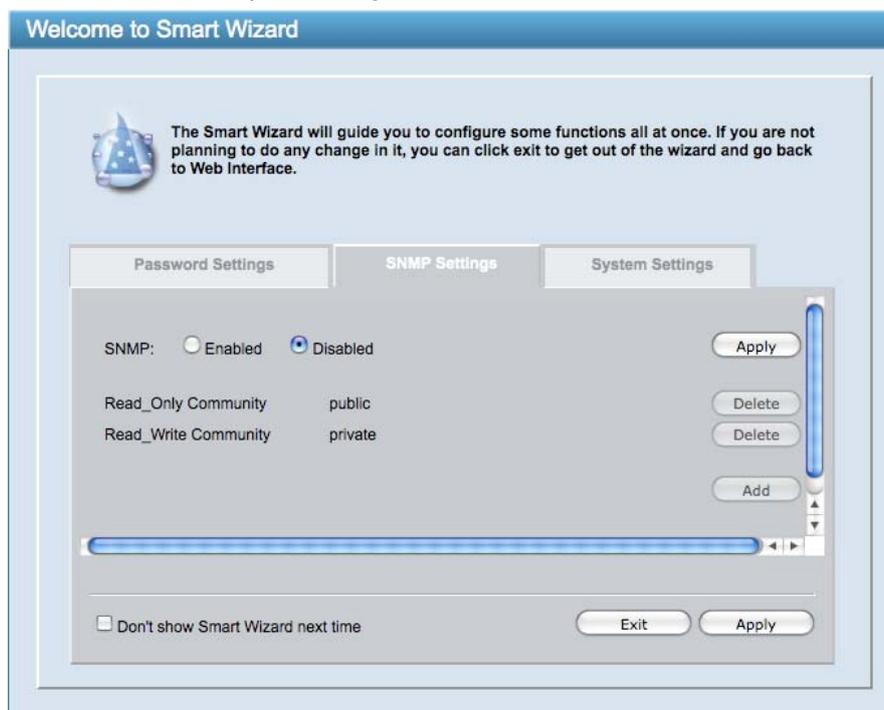

Figure 26 – Configure SNMP in Smart Wizard

System Settings

You can manually change the system IP Address, Subnet Mask, and Gateway address by selecting **Static** and clicking **Apply**. You can further configure and read more about the above settings in the "Setup Menu > System > System Settings". The default setting of System IP address is Static. Select **DHCP** to have the switch obtain an IP address from a DHCP server in the network.

Figure 27 – Configure System IP address in Smart Wizard

> **NOTE:** Changing the system IP address will disconnect you from the current connection. Please enter the correct IP address in the Web browser again and make sure your PC is in the same subnet with the switch. See Login Web-based Management for detailed description.

If you want to change the IP settings, click **OK** and start a new web browser.

Figure 28 – Confirm the changes of IP address in Smart Wizard

Web-based Management

After clicking the **Exit** button in Smart Wizard you will see the screen below:
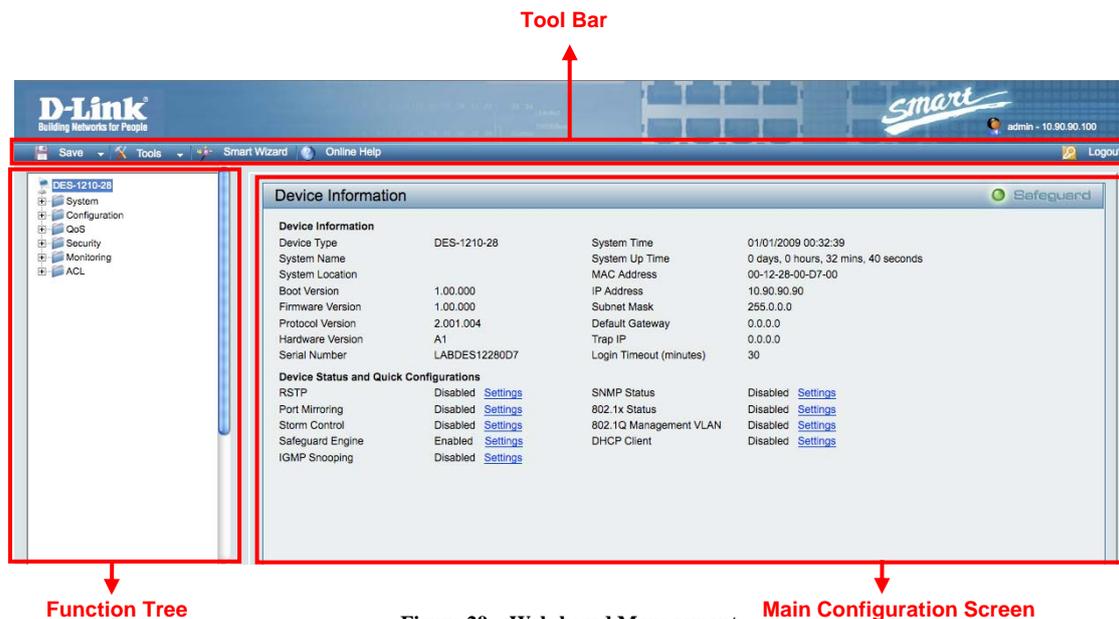

Figure 29 – Web-based Management

Above is the Web-based Management screen. The three main areas are the **Tool Bar** on top, the **Function Tree**, and the **Main Configuration Screen**.

The **Tool Bar** provides a quick and convenient way for essential utility functions like firmware and configuration management.

By choosing different functions in the **Function Tree**, you can change all the settings in the **Main Configuration Screen**. The main configuration screen will show the current status of your Switch by clicking the model name on top of the function tree.

At the upper right corner of the screen the username and current IP address will be displayed.

Under the username is the **Logout** button. Click this to end this session.

> **NOTE:** If you close the web browser without clicking the **Logout** button first, then it will be seen as an abnormal exit and the login session will still be occupied.

Finally, by clicking on the D-Link logo at the upper-left corner of the screen you will be redirected to the local D-Link website.

Tool Bar > Save Menu

The Save Menu provides Save Configuration and Save Log functions.
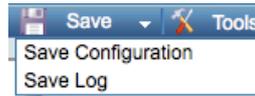

Figure 30 – Save Menu

Save Configuration

Select to save the entire configuration changes you have made to the device to switch's non-volatile RAM.

Figure 31 – Save Configuration

Save Log

Save the log entries to your local drive and a pop-up message will prompt you for the file path. You can view or edit the log file by using text editor (e.g. Notepad).

Figure 32 – Save Log

Tool Bar > Tool Menu

The Tool Menu offers global function controls such as Reset, Reset System, Reboot Device, Configuration Backup and Restore, Firmware Backup and Upgrade.

Figure 33 – Tool Menu

Reset

Provide a safe reset option for the Switch. All configuration settings in non-volatile RAM will be reset to factory default except for the IP address.
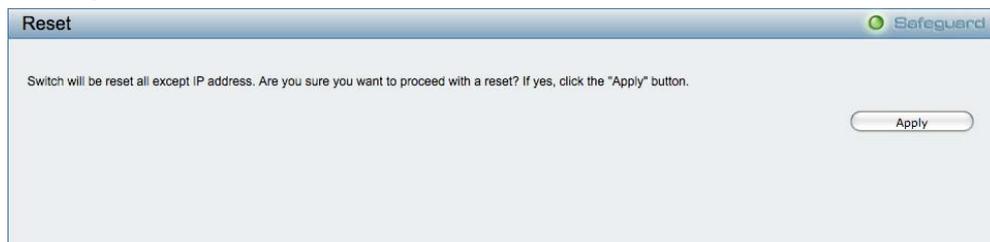

Figure 34 – Tool Menu > Reset

Reset System

Provide another safe reset option for the Switch. All configuration settings in non-volatile RAM will be reset to factory default and then the Switch will reboot.
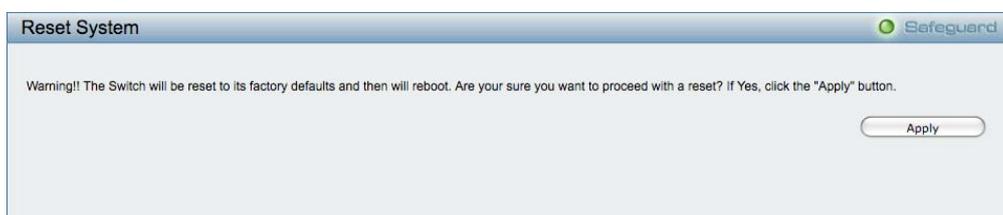

<div align="center">**Figure 35 – Tool Menu > Reset System**</div>

Reboot Device

Provide a safe way to reboot the system. Click **Reboot** to restart the switch.

<div align="center">**Figure 33 – Tool Menu > Reboot Device**</div>

Configuration Backup & Restore

Allow the current configuration settings to be saved to a file (not including the password), and if necessary, you can restore configuration settings from the file. Two methods can be selected: **HTTP** or **TFTP**.
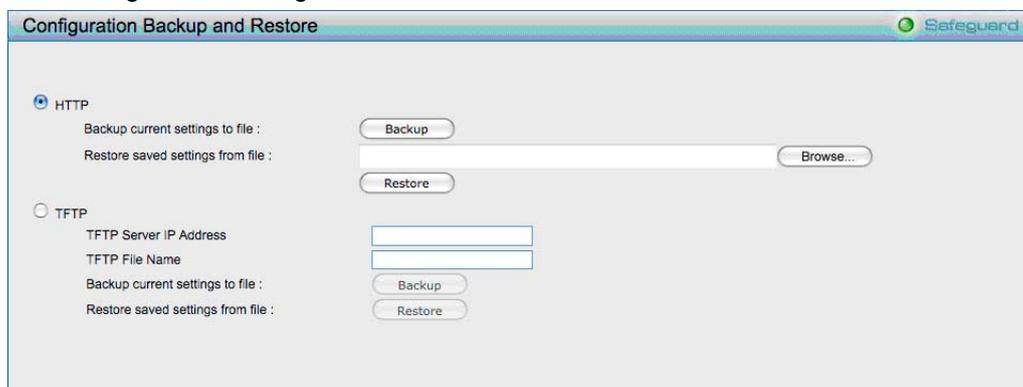

<div align="center">**Figure 36 – Tool Menu > Configure Backup and Restore**</div>

HTTP: Backup or restore the configuration file to or from your local drive.

Click **Backup** to save the current settings to your disk.

Click **Browse** to browse your inventories for a saved backup settings file.

Click **Restore** after selecting the backup settings file you want to restore.

TFTP: TFTP (Trivial File Transfer Protocol) is a file transfer protocol that allows you to transfer files to a remote TFTP server. Specify **TFTP Server IP Address** and **File Name** for the configuration file you want to save to / restore from.

Click **Backup** to save the current settings to the TFTP server.

Click **Restore** after selecting the backup settings file you want to restore.

> **Note:** Switch will reboot after restore and all current configurations will be lost

Firmware Backup and Upload

Allow for the firmware to be saved, or for an existing firmware file to be uploaded to the Switch. Two methods can be selected: **HTTP** or **TFTP**.
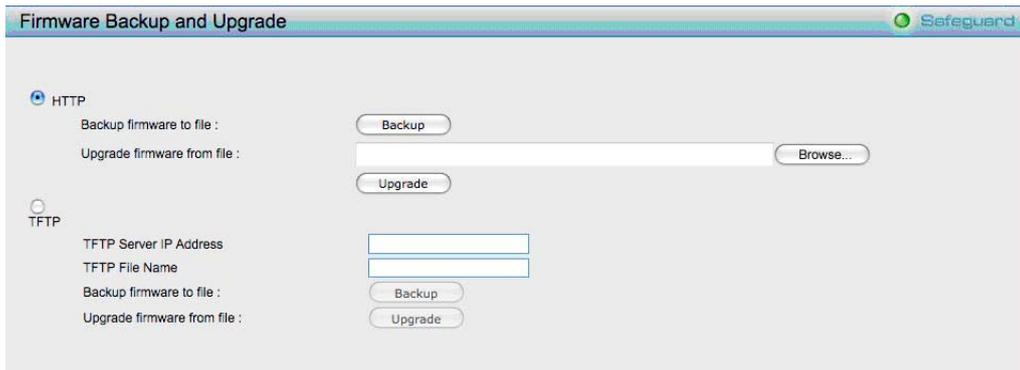

Figure 37 – Tool Menu > Firmware Backup and Upload

HTTP: Backup or upgrade the firmware to or from your local drive of PC.

Click **Backup** to save the firmware to your disk.

Click **Browse** to browse your inventories for a saved firmware file.

Click **Upgrade** after selecting the firmware file you want to restore.

TFTP: Backup or upgrade the firmware to or from a remote TFTP server. Specify **TFTP Server IP Address** and **File Name** for the configuration file you want to save to / restore from.

Click **Backup** to save the firmware to the TFTP server.

Click **Upgrade** after selecting the firmware file you want to restore.

> ⚠ **CAUTION:** Do not disconnect the PC or remove the power cord from device until upgrade complete. Switch may crash if Firmware upgrade incompletely.

Tool Bar > Smart Wizard

By clicking the Smart Wizard button, you can return to the Smart Wizard if you wish to make any changes there.

Tool Bar > Online Help

The Online Help provides two ways of online support: **Online Support Site** will lead you to the D-Link website where you can find online resources such as updated firmware images; **User Guide** can offer an immediate reference for the feature definition or configuration guide.

Figure 38 – Online Help

Figure 39 – User Guide Micro Site

Function Tree

All configuration options on the switch are accessed through the Setup menu on the left side of the screen. Click on the setup item that you want to configure. The following sections provide more detailed description of each feature and function.
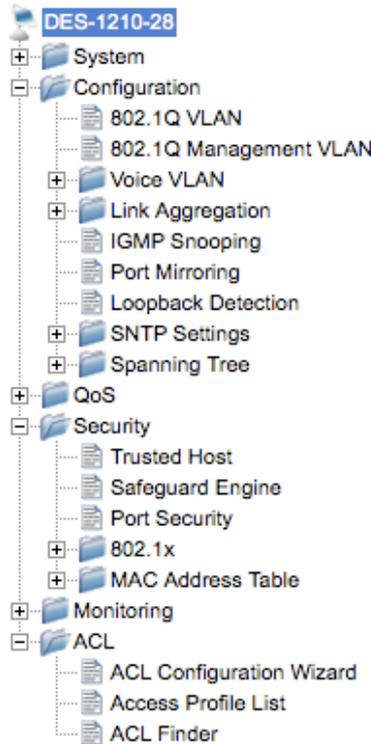

Figure 40 –Function Tree

Device Information

The Device Information provides an overview of the switch, includes essential information such as firmware & hardware information, and IP address.

It also offers an overall status of common software features:

RSTP: Click **Setting** to link to Configuration > Spanning Tree > STP Global Settings. Default is disabled.

Port Mirroring: Click **Setting** to link to Configuration > Port Mirroring. Default is disabled.

Storm Control: Click **Setting** to link to Configuration > QoS > Storm Control. Default is disabled.

Safeguard Engine: Click **Setting** to link to Configuration > Security > Safeguard Engine. Default is enabled.

IGMP Snooping: Click **Setting** to link to Configuration > IGMP Snooping. Default is disabled.

SNMP: Click **Setting** to link to System > SNMP Setting. Default is disabled.

802.1X: Click **Setting** to link to Configuration > Security > 802.1X > 802.1X Settings. Default is disabled.

802.1Q Management VLAN: Click **Setting** to link to Configuration > 802.1Q Management VLAN. Default is disabled.

DHCP Client: Click **Setting** to link to System > System Setting. Default is disabled.

Figure 38 – Device Information

System > System Settings

The System Setting allows the user to configure the IP address and the basic system information of the Switch.

IP Information: There are two ways for the switch to obtain an IP address: Static and DHCP (Dynamic Host Configuration Protocol).

When using static mode, the **IP Address**, **Subnet Mask** and **Gateway** can be manually configured. When using DHCP mode, the Switch will first look for a DHCP server to provide it with an IP address (including network mask and default gateway) before using the default or previously entered settings. By default the IP setting is static mode with IP address is **10.90.90.90** and subnet mask is **255.0.0.0**.

**System Information:** By entering a **System Name** and **System Location**, the device can more easily be recognized through the SmartConsole Utility and from other Web-Smart devices on the LAN.

Login Timeout: The Login Timeout controls the idle time-out period for security purposes, when there is no action for a specific time span in the Web-based Management. If the current session times out (expires), the user is required a re-login before using the Web-based Management again. Selective range is from 3 to 30 minutes, and the default setting is 5 minutes.

Group Interval: The D-Link Web Smart Switch will routinely send report packets to the SmartConsole Utility in order to maintain the information integrity. The user can adjust the **Group Interval** to optimal frequency. Selective range is from 120 to 1225 seconds, and 0 means disabling the reporting function.

Figure 39 – System > System Setting

System > Trap Settings For SmartConsole

By configuring the Trap Setting, it allows SmartConsole Utility to monitor specified events on this Web-Smart Switch. By default, Trap Setting is disabled. When the Trap Setting is enabled, enter the **Destination IP** address of the managing station that will receive trap information.

Figure 40 – System > Trap Setting

You can select which event message(s) to be sent to the managing station

System Event: The system level messages, which contains:

> **Device Bootup -** System boot-up information.
>
> **Illegal Login -** Events of incorrect password logins, recording the IP of the originating PC.

Fiber Port Link Up/Link Down: Fiber port connection information.

Twisted pair Port Link Up/Link Down: Copper port connection information.

RSTP Port State Change: Events of a RSTP port state changes.

Firmware Upgrade State: Information of firmware upgrade success or failure.

System > Port Settings

In the Port Setting page, the status of all ports can be monitored and adjusted for optimum configuration. By selecting a range of ports (**From Port** and **To Port**), the **Speed** can be set for all selected ports, effective by clicking **Apply**. Press the **Refresh** button to view the latest information.

<p align="center">Figure 41 – System > Port Setting</p>

Speed: Gigabit Fiber connections can operate in 1000M Full Force Mode, Auto Mode or Disabled. Copper connections can operate in Forced Mode settings (1000M Full, 100M Full, 100M Half, 10M Full, 10M Half), Auto, or Disabled. 100M Fiber connections support 100M Full Force Mode, 100M Half Force Mode, or Disabled. The default setting for all ports is **Auto**.

> **NOTE:** Be sure to adjust port speed settings appropriately after changing connected cable media types.

MDI/MDIX:

A **medium dependent interface** (**MDI**) port is an Ethernet port connection typically used on the Network Interface Card (NIC) or Integrated NIC port on a PC. Switches and hubs usually use **Medium dependent interface crossover (MDIX)** interface. When connecting the Switch to end stations, user have to use straight through Ethernet cables to make sure the Tx/Rx pairs match up properly. When connecting the Switch to other networking devices, a crossover cable must be used.

This switch provides configurable **MDI/MDIX** function for users. The switches can set as an MDI port in order to connect to other hubs or switches without an Ethernet crossover cable.

Auto MDI/MDIX is designed on the switch to detect if the connection is backwards and automatically chooses MDI or MDIX to properly match the connection. The default setting is "**Auto**" **MDI/MDIX**.

Flow Control: You can enable this function to mitigate the traffic congestion. Ports configured for full-duplex use 802.3x flow control, half-duplex ports use backpressure flow control. The default setting is Disabled.

Link Status: Reporting **Down** indicates the port is disconnected.

<p align="center">28</p>

System > SNMP Settings

Simple Network Management Protocol (SNMP) is an OSI Layer 7 (Application Layer) protocol designed specifically for managing and monitoring network devices. SNMP enables network management stations to read and modify the settings of gateways, routers, switches, and other network devices. Use SNMP to configure system features for proper operation, monitor performance and detect potential problems in the Switch or LAN.

Managed devices that support SNMP include software (referred to as an agent), which runs locally on the device. A defined set of variables (managed objects) is maintained by the SNMP agent and used to manage the device. These objects are defined in a Management Information Base (MIB), which provides a standard presentation of the information controlled by the on-board SNMP agent. SNMP defines both the format of the MIB specifications and the protocol used to access this information over the network.

The default SNMP setting is disabled. Click **Enabled** to set Community Settings and then **Apply**.

Figure 42 – System > SNMP Setting

Community Setting: In support of SNMP version 1, the Web-Smart Switch accomplishes user authentication by using Community Settings that function as passwords. The remote user SNMP application and the Switch SNMP must use the same community string. SNMP packets from a station that are not authenticated are ignored (dropped).

The default community strings for the Switch used for SNMP v.1 management access are:

Read_Only: The community with read-only privilege allows authorized management stations to retrieve MIB objects. The default name is **public**.

Read_Write: The community with read/write privilege allows authorized management stations to retrieve and modify MIB objects. The default name is **private**.

Trap Setting: Traps are messages that alert network personnel of events that occur on the Switch. Such events can be as severe as a reboot (someone accidentally turned the Switch OFF), or less serious events such as a port status change. The Switch can generate traps and send them to the trap recipient (i.e. network administrator).

Setting up a Trap: Select **Enable**, enter a Trap Name, add the IP of the device to be monitored, and select the event(s) to trap. The available trap Events to choose from include:

> SNMP Authentication Traps
> System Device Bootup
> Fiber Link Up / Link Down
> Twisted Pair Link Up / Link Down
> RSTP Port State Change
> Firmware Upgrade State

> **Note:** Trap Name must be selected from a Community Name

System > Password Access Control

Setting a password is a critical tool for managers to secure the Web-Smart Switch. After entering the old password and the new password two times, click **Apply** for the changes to take effect.

Figure 43 – System > Password Access Control

System > System Log Settings

System Logs record and manage events, as well as report errors and informational messages. Message severity determines a set of event message will be sent. Click **Enable** so you can start to configure the related settings of remote system log server, then press **Apply** for the changes to take effect.

Figure 44 – System > System Log Settings

Server IP Address: Specifies the IP address of the system log server.

UDP Port: Specifies the UDP port to which the server logs are sent. The possible range is 1 – 65535, and the default value is 514.

Time Stamp: Select Enable to time stamp log messages.

Severity: Specifies the minimum severity from which warning messages are sent to the server. There are three levels. When a severity level is selected, all severity level choices above the selection are selected automatically. The possible levels are:

Warning - The lowest level of a device warning. The device is functioning, but an operational problem has occurred.

Informational - Provides device information.

All - Displays all levels of system logs.

Facility: Specifies an application from which system logs are sent to the remote server. Only one facility can be assigned to a single server. If a second facility level is assigned, the first facility is overwritten. There are up to eight facilities can be assigned (Local 0 ~ Local 7),

Configuration > 802.1Q VLAN

A VLAN is a group of ports that can be anywhere in the network, but communicate as though they were in the same area.

VLANs can be easily organized to reflect department groups (such as R&D, Marketing), usage groups (such as e-mail), or multicast groups (multimedia applications such as video conferencing), and therefore help to simplify network management by allowing users to move devices to a new VLAN without having to change any physical connections.

The IEEE 802.1Q VLAN Configuration page provides powerful VID management functions. The original settings have the VID as 1, no default name, and all ports as "Untagged"

Rename: Click to rename the VLAN group.

Delete VID: Click to delete the VLAN group.

Add New VID: Click to create a new VID group, assigning ports from 01 to 28 as **Untag**, **Tag**, or **Not Member**. A port can be untagged in only one VID. To save the VID group, click **Apply.**

You may change the name accordingly to the desired groups, such as R&D, Marketing, email, etc.
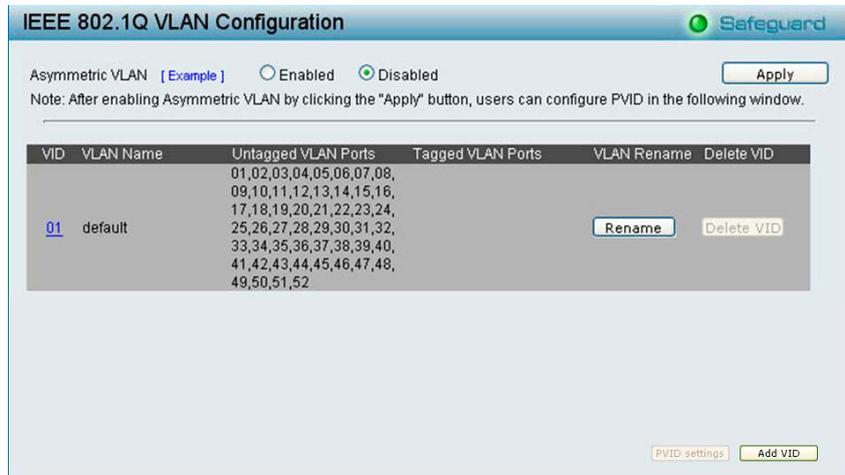

Figure 45 – Configuration > 802.1Q VLAN > Default Setting
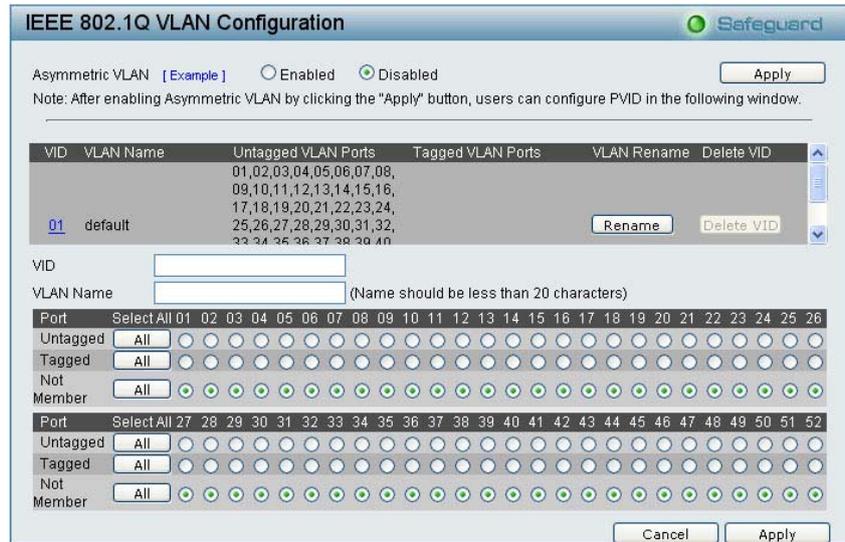

Figure 46 – Configuration > 802.1Q VLAN > Add VID
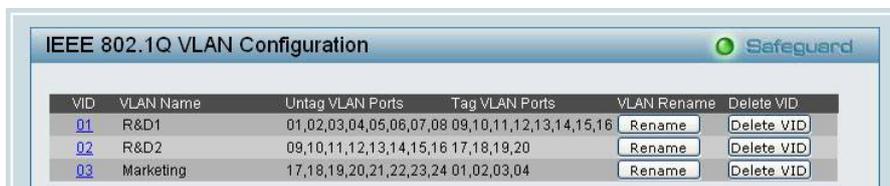

Figure 47 – Configuration > 802.1Q VLAN > Example VIDs

Figure 48 – Configuration > 802.1Q VLAN > VID Assignments

Configuration > Asymmetric VLAN

This function is located in the 802.1Q Configuration page. It allows devices in different VLANs to communicate with the servers, firewalls or other shared resources in the shared VLAN. This configuration is accomplished in three steps:

- ➢ Enabling Asymmetric VLAN function
- ➢ Creating shared VLAN and access VLAN
- ➢ Configuring the PVID of access VLAN

Asymmetric VLAN is especially effective when used in a small network where a L3 routing device is absent, or if the resource to be shared is not capable of supporting tagged VLAN (for example, a printer).

The example below is a typical application of Asymmetric VLAN. Servers and firewall are located in shared VLAN (default VLAN), and PCs 1, 2 and 3 are located in different VLAN. Because VLANs remain separate, PCs 1, 2, and 3 cannot communicate with each other; but all of them need to access the servers or the Internet behind the firewall.
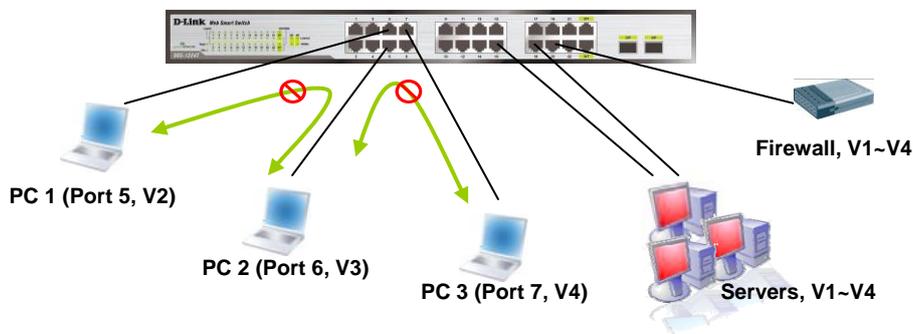

Figure 49 – Configuration > 802.1Q VLAN > Asymmetric VLAN Example

1. Enable Asymmetric VLAN

Enable Asymmetric VLAN and click **Apply** button. The overlapping VLAN cannot be configured unless this function is enabled..
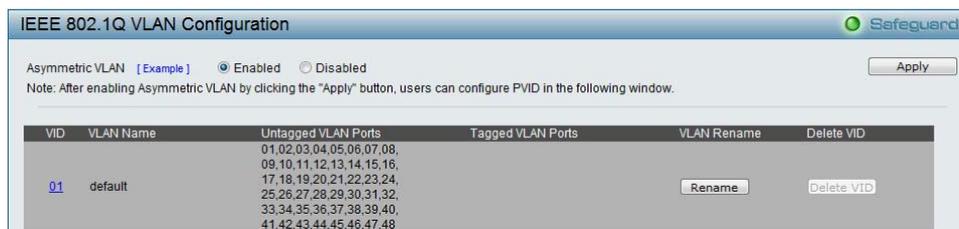

Figure 50 – Configuration > 802.1Q VLAN > Asymmetric VLAN - Enabling Asymmetric VLAN

2. Configure the shared VLAN (VLAN 1) and access VLANs (VLAN 2, 3, 4)

In this case, the default VLAN is used as shared VLAN, and the ports that are shared in the network are:

> Ports 15-18 are connected to the server
> Port 20 is connected to the firewall

The group of shared ports needs to be included for all the VLANs. Ports 15-18, 20 already belong to VLAN 1, therefore no changes are needed.

VLAN 2 is configured to include ports 15-18, 20 (shared VLAN ports) and the set of ports to be separated from the other VLANs (for example, port 5). VLAN 3 and 4 are then configured to include shared ports and the set of ports to be separated from the other VLANs (for example, port 6 and 7 respectively). Therefore we have three VLANs that share some common ports, but their original membership ports are still separated from each other (for example, port 5, 6, and 7).

The VLAN settings of this example are:

> VLAN 1: default VLAN 1, including all ports with untagged.
> VLAN 2: Member ports are untagged port 5, 15-18, 20.
> VLAN 3: Member ports are untagged port 6, 15-18, 20.
> VLAN 4: Member ports are untagged port 7, 15-18, 20.
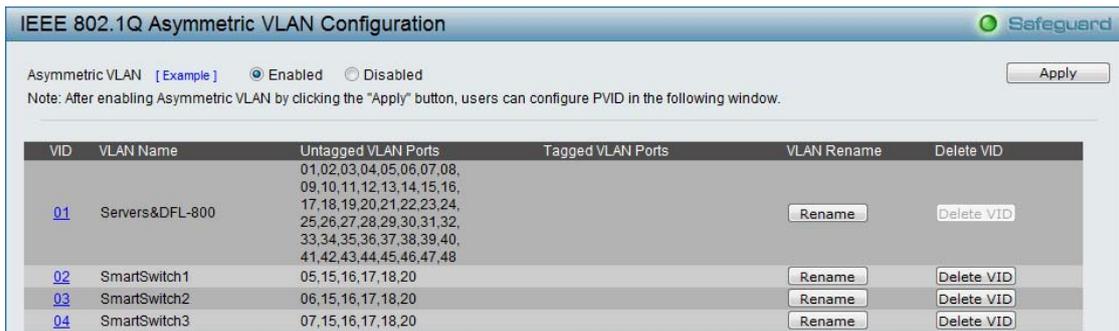

Figure 41 – Configuration > 802.1Q VLAN > Asymmetric VLAN – Create VLANs

3. Configuring the PVID of access VLAN

Configure the PVID setting located at the bottom of the VLAN configuration page. The user needs to set the shared set of ports as PVID 1, and the other separated groups of ports (for example, port 5, 6, and 7) as PVID 2, 3 and 4 respectively.

The purpose of assigning PVID is to make sure the untagged packets will be transmitted correctly.
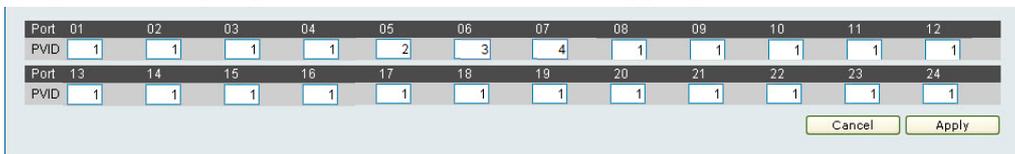

Figure 42 – Configuration > 802.1Q VLAN > Asymmetric VLAN – Assign PVID

After configuration, the user will be able to share the network resources set on the shared group of ports (nominated as PVID 1), with both smaller subsets of VLANs (nominated PVID 2, 3 and 4). However, VLAN 2, 3 and 4 groups are incapable of sharing information with each other directly. Click **Example** to see the example to configure asymmetric VLAN in larger networks.

> **Note:** When Asymmetric VLAN is enabled, IGMP Snooping, Management VLAN, and MAC address table will be reset to default.

Configuration > 802.1Q Management VLAN

The 802.1Q Management VLAN setting allows you to transfer the authority of the switch from the default VLAN to others created by users. This allows managing the whole network more flexible.

By default, the Management VLAN is disabled. You can select any existing VLAN as the management VLAN when this function is enabled. There can only be one management VLAN at a time.

Figure 43 – Configuration > 802.1Q Management VLAN

Configuration > Voice VLAN > Voice VLAN Setting

Voice VLAN is a feature that allows you to automatically place the voice traffic from IP phone to an assigned VLAN to enhance the VoIP service. With a higher priority and individual VLAN, the quality and the security of VoIP traffic are guaranteed. The Voice VLAN function will only insert the Voice VLAN tag to untagged packets under corresponding ports. If a VoIP packet comes with a VLAN tag, the Voice VLAN function won't replace the original VLAN tag.

Figure 44 – Configuration > Voice VLAN > Voice VLAN Setting

Voice VLAN State: Select to enable or disable Voice VLAN. The default is *Disabled.* After you enabled Voice VLAN, you can configure the **Voice VLAN Global Settings**.

VLAN ID: The ID of VLAN that you want to assign voice traffic to. You must first create a VLAN from the 802.1Q VLAN page before you can assign a dedicated Voice VLAN. The member port you configured in 802.1Q VLAN setting page will be the static member port of voice VLAN. To dynamically add ports into the voice VLAN, please enable the **Auto Detection** function

Priority: The 802.1p priority levels of the traffic in the Voice VLAN.

Aging Time: Enter a period of time in hours to remove a port from voice VLAN if the port is an automatic VLAN member. When the last voice device stops sending traffic and the MAC address of this voice device is aged out, the voice VLAN aging timer will be started. The port will be removed from the voice VLAN after expiration of voice VLAN aging timer. Selectable range is from 1 to 120 hours and default is 1 hour.

From Port / To Port: A consecutive group of ports may be configured starting with the selected port.

Auto Detection: Switch will add ports to the voice VLAN automatically if it detects the device OUI matches the Telephony OUI configured in Voice VLAN OUI Setting page. Use the drop-down menu to enable or disable the OUI auto detection function. The default is *Disabled*

Click **Apply** to implement changes made.

> **Note:** Voice VLAN has higher priority than any other features even QoS. Therefore the voice

> traffic will be operated according to Voice VLAN setting and not impacted by QoS feature.

Configuration > Voice VLAN > Voice VLAN OUI Setting

This window allows the user to configure the user-defined voice traffic's OUI. An Organizationally Unique Identifier (OUI) is the first three bytes of the MAC address. This identifier uniquely identifies a vendor, manufacturer, or other organization.

Figure 45 – Configuration > Voice VLAN > Voice VLAN OUI Setting

There are some pre-defined OUIs and when the user configures personal OUI, these pre-defined OUIs must be avoided. Below are the pre-defined voice traffic's OUI:

OUI	Vendor	Mnemonic Name
00:E0:BB	3COM	3com
00:03:6B	Cisco	cisco
00:E0:75	Veritel	veritel
00:D0:1E	Pingtel	pingtel
00:01:E3	Siemens	siemens
00:60:B9	NEC/ Philips	nec&philips
00:0F:E2	Huawei-3COM	huawei&3com
00:09:6E	Avaya	avaya

Default OUI: Pre-defined OUI values, including brand names of 3COM, Cisco, Veritel, Pingtel, Siemens, NEC/Philips, Huawei3COM, and Avaya.

User defined OUI: You can manually create a Telephony OUI with a description. The maximum number of user defined OUIs is 10. It will occupy one ACL rule when selecting user defined OUI by default, and to configure one user-defined OUI will take extra one ACL rule. System will auto generate an ACL profile (Profile ID: 51) for all the Voice VLAN rules.

Select the OUI and press **Add** to the lower table to complete the Auto Voice VLAN setting.

Configuration > Link Aggregation > Port Trunking

The Trunking function enables the combining of two or more ports together to increase bandwidth. Up to eight Trunk groups may be created, and each group can be consisted of up to eight ports. Select the ports to be grouped together, and then click **Apply** to activate the selected Trunking groups. Two types of link aggregation can be selected:

Static - Static link aggregation.

LACP - LACP (Link Aggregation Control Protocol) is enabled on the device. LACP allows for the automatic detection of links in a Port Trunking Group.

Disable - Remove all the member in this trunk group.
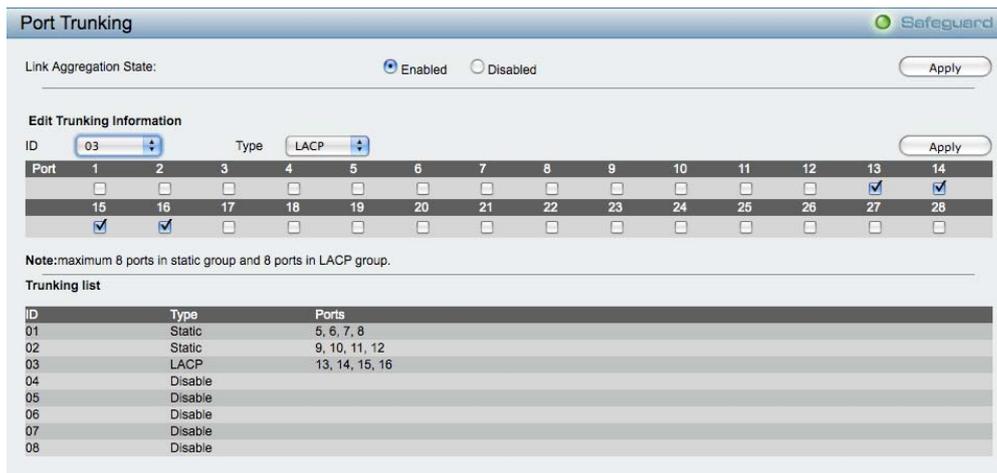

Figure 46 – Configuration > Link Aggregation > Port Trunking

> **NOTE:** Each combined trunk port must be connected to devices within the same VLAN group.

Configuration > Link Aggregation > LACP Port Settings

The **LACP Port Settings** is used to create port trunking groups on the Switch. The user may set which ports will be active and passive in processing and sending LACP control frames
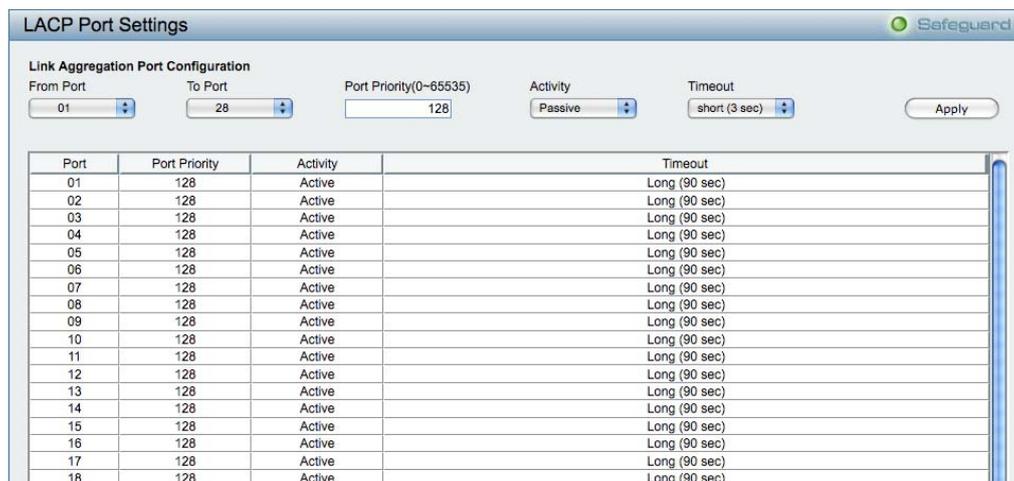

Figure 53 – Configuration > Link Aggregation > LACP Port Settings

From Port: The beginning of a consecutive group of ports may be configured starting with the selected port.

To Port: The ending of a consecutive group of ports may be configured starting with the selected port.

Port Priority (0-65535): Displays the LACP priority value for the port. Default is 128.

Activity: There are two different roles of LACP ports:

Active - Active LACP ports are capable of processing and sending LACP control frames. This allows LACP compliant devices to negotiate the aggregated link so the group may be changed dynamically as needs require. In order to utilize the ability to change an aggregated port group, that is, to add or subtract ports from the group, at least one of the participating devices must designate LACP ports as active. Both devices must support LACP.

Passive - LACP ports that are designated as passive cannot initially send LACP control frames. In order to allow the linked port group to negotiate adjustments and make changes dynamically, one end of the connection must have "active" LACP ports.

Timeout: Specify the administrative LACP timeout. The possible field values are:

> **Short (3 Sec)** - Defines the LACP timeout as 3 seconds.
>
> **Long (90 Sec)** - Defines the LACP timeout as 90 seconds. This is the default value.

Click **Apply** to implement the changes made.

Configuration > IGMP Snooping

With Internet Group Management Protocol (IGMP) snooping, the Web Smart Switch can make intelligent multicast forwarding decisions by examining the contents of each frame's Layer 2 MAC header.

IGMP snooping can help reduce cluttered traffic on the LAN. With IGMP snooping enabled globally, the Web Smart Switch will forward multicast traffic only to connections that have group members attached.

The settings of IGMP snooping is set by each VLAN individually.

Figure 54 – Configuration > IGMP Snooping Configuration

By default, IGMP is disabled. If enabled, the IGMP Global Settings will need to be entered:

Host Timeout (130-153025 sec): This is the interval after which a learned host port entry will be purged. For each host port learned, a 'Port Purge Timer' runs for 'Host Port Purge Interval'. This timer will be restarted whenever a report message from host is received over that port. If no report messages are received for 'Host Port Purge Interval' time, the learned host entry will be purged from the multicast group. The default value is 260 seconds.

Robustness Variable (2-255 sec): The Robustness Variable allows adjustment for the expected packet loss on a subnet. If a subnet is expected to be lossy, the Robustness Variable may need to be increased. The Robustness Variable cannot be set to zero, and it SHOULD NOT be. Default is 2 seconds.

Query Interval (60-600 sec): The Query Interval is the interval between General Queries sent. By adjusting the Query Interval, the number of IGMP messages can be increased or decreased; larger values will cause IGMP Queries to be sent less often. Default value is 125 seconds.

Router Timeout (60-600 sec): This is the interval after which a learned router port entry will be purged. For each router port learned, a 'Router Port Purge Timer' runs for 'Router Port Purge Interval'. This timer will be restarted whenever a Query control message is received over that port. If no Query control messages are received for 'Router Port Purge Interval' time, the learned router port entry will be purged. Default is 260 seconds.

Last Member Query Interval (1-25 sec): The Last Member Query Interval is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages, and is also the amount of time between Group-Specific Query messages. This value may be adjusted to modify the "leave latency" of the network. A reduced value results in reduced time to detect the loss of the last member of a group. Default is 1 second.

Max Response Time (10-25 sec): The Max Response Time specifies the maximum allowed time before sending a responding report message. Adjusting this setting effects the "leave latency", or the time between the moment the last host leaves a group and when the multicast server is notified that there are no more members. It also allows adjustments for controlling the frequency of IGMP traffic on a subnet. Default is 10 seconds.

Querier State: D-Link Smart Switch is able to send out the IGMP Queries to check the status of multicast clients. Default is disabled.

To enable IGMP snooping for a given VLAN, select enable and click on the **Apply** button. Then press the **Edit** button under **Router Port Setting**, and select the ports to be assigned as router ports for IGMP snooping for the VLAN, and press **Apply** for changes to take effect. A router port configured manually is a **Static Router Port**, and a **Dynamic Router Port** is dynamically configured by the Switch when query control message is received.
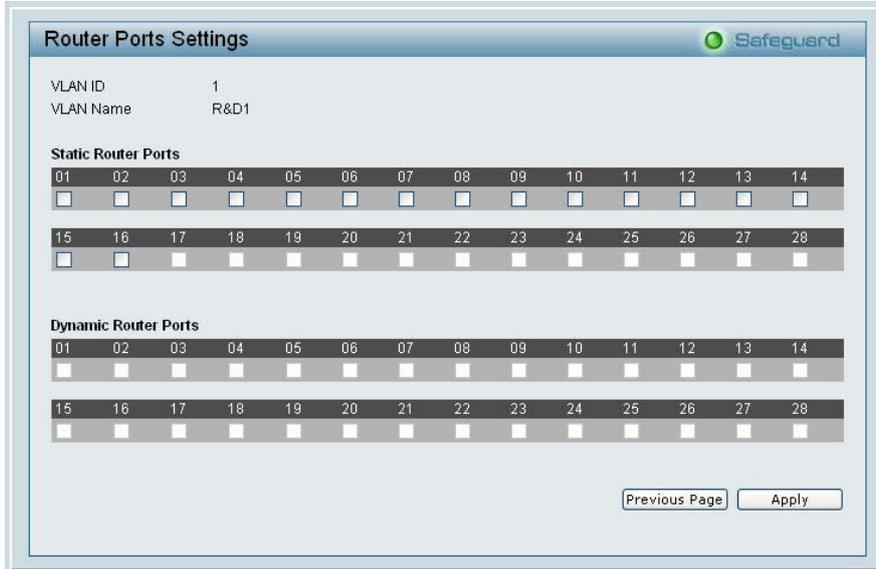

Figure 47 – Configuration > IGMP Router port Settings

To view the Multicast Entry Table for a given VLAN, press the **View** button.

Figure 48 – Configuration > IGMP Multicast Entry Table

Configuration > Port Mirroring

Port Mirroring is a method of monitoring network traffic that forwards a copy of each incoming and/or outgoing packet from one port of the Switch to another port where the packet can be studied. This enables network managers to better monitor network performances.
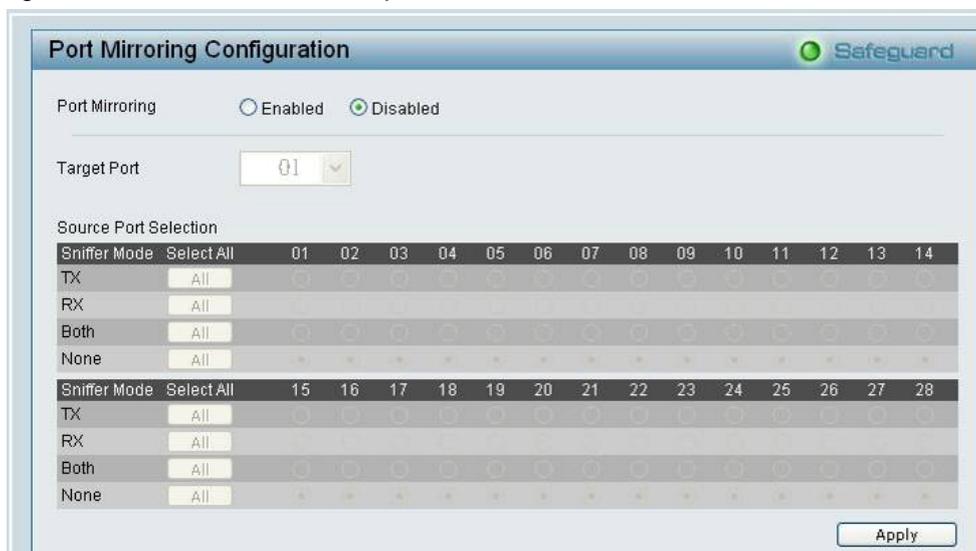

Figure 49 – Configuration > Port Mirroring

Selection options for the Source Ports are as follows:

TX (transmit) mode: Duplicates the data transmitted from the source port and forwards it to the Target Port. Click "all" to include all ports into port mirroring.

RX (receive) mode: Duplicates the data that received from the source port and forwards it to the Target Port. Click "all" to include all ports into port mirroring.

Both (transmit and receive) mode: Duplicate both the data transmitted from and data sent to the source port, and forwards all the data to the assigned Target Port. Click "all" to include all ports into port mirroring.

None: Turns off the mirroring of the port. Click "all" to remove all ports from mirroring.

Configuration > Loopback Detection

The Loopback Detection function is used to detect the loop created by a specific port while Spanning Tree Protocol (STP) is not enabled in the network, especially when the down links are hubs or unmanaged switchs. The Switch will automatically shutdown the port and sends a log to the administrator. The Loopback Detection port will be unlocked when the Loopback Detection **Recover Time** times out. The Loopback Detection function can be implemented on a range of ports at a time. You may enable or disable this function using the pull-down menu.

Figure 50 – Configuration > Loopback Detection

Loopback Detection State: Use the drop-down menu to enable or disable loopback detection. The default is *Disabled.*

Interval (1-32767): Set a Loop detection Interval between *1* and *32767* seconds. The default is *1* seconds.

Recover Time (0 or 60-1000000): Time allowed (in seconds) for recovery when a Loopback is detected. The Loop Detection Recover Time can be set at *0* seconds, or *60* to *1000000* seconds. Entering *0* will disable the Loop Detection Recover Time. The default is *60* seconds.

From Port: The beginning of a consecutive group of ports may be configured starting with the selected port.

To Port: The ending of a consecutive group of ports may be configured starting with the selected port.

State: Use the drop-down menu to toggle between *Enabled* and *Disabled.* Default is *Disabled.*

Click **Apply** to implement changes made.

Configuration > SNTP Settings > Time Settings

SNTP or Simple Network Time Protocol is used by the Switch to synchronize the clock of the computer. The SNTP settings folders contain two windows: Time Settings and TimeZone Settings. Users can configure the time settings for the switch, and the following parameters can be set or are displayed in the Time Settings page.

Figure 51 – Configuration > SNTP Settings > Time Settings

Clock Source: Specify the clock source by which the system time is set. The possible options are:
>   **Local -** Indicates that the system time is set locally by the device.
>   **SNTP -** Indicates that the system time is retrieved from a SNTP server.

Current Time: Displays the current date and time for the switch.

If choosing **SNTP** for the clock source, then the following parameters will be available:
SNTP First Server: Specify the IP address of primary SNTP server from which the system time is retrieved.
SNTP Second Server: Specify the IP address of secondary SNTP server from which the system time is retrieved.
SNTP Poll Interval in Seconds (30-99999): Defines the interval (in seconds) at which the SNTP server is polled for Unicast information. The Poll Interval default is 30 seconds.

Click **Apply** to implement changes made.

When selecting **Local** for the clock source, users can select from one of two options:
Manually set current time: Users input the system time manually.
Set time from PC: The system time will be synchronized from the local computer.

Configuration > SNTP Settings > TimeZone Settings
The TimeZone Setting Page is used to configure time zones and Daylight Savings time settings for SNTP.

Figure 52 – Configuration > SNTP Settings > TimeZone Settings

Daylight Saving Time State: Use this drop-down menu to enable or disable the DST Settings.

Daylight Saving Time Offset in Minutes: Use this drop-down menu to specify the amount of time that will constitute your local DST offset - *30*, *60*, *90*, or *120* minutes.

Time Zone Offset from GMT in +/- HH:MM: Use these drop-down menus to specify your local time zone's offset from Greenwich Mean Time (GMT.)

DST Annual Settings: Using annual mode will enable DST seasonal time adjustment. Annual mode requires that the DST beginning and ending date be specified concisely is not in the same month. For example, specify to begin DST on March 8 and end DST on November 1.

From: Month: Enter the month DST will start on, each year.

From: Day: Enter the day of the week DST will start on, each year.

From: Time in HH:MM: Enter the time of day DST will start on, each year.

To: Month: Enter the month DST will end on, each year.

To: Day: Enter the date DST will end on, each year.

To: Time in HH:MM: Enter the time of day that DST will end on, each year.

Click **Apply** to implement changes made.

Configuration > Spanning Tree > STP Global Settings

The Switch implements two versions of the Spanning Tree Protocol, the Rapid Spanning Tree Protocol (RSTP) as defined by the IEEE 802.1w specification and a version compatible with the IEEE 802.1D STP. RSTP can operate with legacy equipment implementing IEEE 802.1D, however the advantages of using RSTP will be lost.

The IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) evolved from the 802.1D STP standard. RSTP was developed in order to overcome some limitations of STP that impede the function of some recent switching innovations. The basic function and much of the terminology is the same as STP. Most of the settings configured for STP are also used for RSTP. This section introduces some new Spanning Tree concepts and illustrates the main differences between the two protocols.

By default, Rapid Spanning Tree is disabled. If enabled, the Switch will listen for BPDU packets and its accompanying Hello packet. BPDU packets are sent even if a BPDU packet was not received. Therefore, each link between bridges is sensitive to the status of the link. Ultimately this difference results in faster detection of failed links, and thus faster topology adjustment.

After enabling STP, setting the STP Global Setting includes the following options:

Figure 53 – Configuration > Spanning Tree > STP Global Settings

STP Version: You can choose RSTP or STP Compatible. The default setting is RSTP.

Bridge Priority: This value between 0 and 61410 specifies the priority for forwarding packets: the lower the value, the higher the priority. The default is 32768.

TX Hold Count (1-10): Used to set the maximum number of Hello packets transmitted per interval. The count can be specified from *1* to *10*. The default is *6.*

Maximum Age (6-40 sec): This value may be set to ensure that old information does not endlessly circulate through redundant paths in the network, preventing the effective propagation of the new information. Set by the Root Bridge, this value will aid in determining that the Switch has spanning tree configuration values consistent with other devices on the bridged LAN. If the value ages out and a BPDU has still not been received from the Root Bridge, the Switch will start sending its own BPDU to all other switches for permission to become the Root Bridge. If it turns out that the Switch has the lowest Bridge Identifier, it will become the Root Bridge. A time interval may be chosen between 6 and 40 seconds. The default value is 20. (Max Age has to have a value bigger than Hello Time)

Hello Time (1-10 sec): The user may set the time interval between transmissions of configuration messages by the root device, thus stating that the Switch is still functioning. The default is 2 seconds.

Forward Delay (4-30 sec): This sets the maximum amount of time that the root device will wait before changing states. The default is 15 seconds.

Root Bridge: Displays the MAC address of the Root Bridge.

Root Maximum Age: Displays the Maximum Age of the Root Bridge.

Root Forward Delay: Displays the Forward Delay of the Root Bridge.

Root port: Displays the root port.

Click **Apply** for the settings to take effect. Click **Refresh** to renew the page.

Configuration > Spanning Tree > STP Port Settings

STP can be set up on a port per port basis. In addition to setting Spanning Tree parameters for use on the switch level, the Switch allows for the configuration of groups of ports, each port-group of which will have its own spanning tree, and will require some of its own configuration settings.

An STP Group spanning tree works in the same way as the switch-level spanning tree, but the root bridge concept is replaced with a root port concept. A root port is a port of the group that is elected based on port priority and port cost, to be the connection to the network for the group. Redundant links will be blocked, just as redundant links are blocked on the switch level.

The STP on the switch level blocks redundant links between switches (and similar network devices). The port level STP will block redundant links within an STP Group.

It is advisable to define an STP Group to correspond to a VLAN group of ports.

| Port	State	Priority	External Cost	Edge	P2P	Restricted Role	Restricted TCN	Port State
01	Enable	128	AUTO/200000	Auto	Auto	False	False	Forwarding
02	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
03	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
04	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
05	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
06	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
07	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
08	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
09	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
10	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
11	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking
12	Enable	128	AUTO/2000000	Auto	Auto	False	False	Blocking

Figure 57 – Configuration > Spanning Tree > STP Port Settings

From Port/To Port: A consecutive group of ports may be configured starting with the selected port.

State: Use the drop-down menu to enable or disable STP by per-port based. It will be selectable after the global STP is enabled.

External Cost: This defines a metric that indicates the relative cost of forwarding packets

to the specified port list. Port cost can be set automatically or as a metric value. The

default value is *0* (auto).

> **0 (auto) -** Setting 0 for the external cost will automatically set the speed for forwarding packets to the specified port(s) in the list for optimal efficiency. Default port cost: 100Mbps port = 200000. Gigabit port = 20000.

> **Value 1-200000000 -** Define a value between 1 and 200000000 to determine the external cost. The lower the number, the greater the probability the port will be chosen to forward packets.

Migrate: Setting this parameter as *Yes* will set the ports to send out BPDU packets to other bridges, requesting information on their STP setting. If the Switch is configured for RSTP, the port will be capable to migrate from 802.1d STP to 802.1w RSTP. Migration should be set as yes on ports connected to network stations or segments that are capable of being upgraded to 802.1w RSTP on all or some portion of the segment.

Edge: Selecting the *True* parameter designates the port as an edge port. Edge ports cannot create loops, however an edge port can lose edge port status if a topology change creates a potential for a loop. An edge port normally should not receive BPDU packets. If a BPDU packet is received, it automatically loses edge port status. Selecting the *False* parameter indicates that the port does not have edge port status. Selecting the *Auto* parameter indicates that the port have edge port status or not have edge port status automatically.

Priority: Specify the priority of each port. Selectable range is from 0 to 240, and the default setting is 128. The lower the number, the greater the probability the port will be chosen as a root port.

P2P: Choosing the *True* parameter indicates a point-to-point (P2P) shared link. P2P ports are similar to edge ports, however they are restricted in that a P2P port must operate in full-duplex.

Like edge ports, P2P ports transition to a forwarding state rapidly thus benefiting from RSTP. A p2p value of *false* indicates that the port cannot have p2p status. *Auto* allows the port to have p2p status whenever possible and operate as if the p2p status were true. If the port cannot maintain this status, (for example if the port is forced to half-duplex operation) the p2p status changes to operate as if the p2p value were *False*. The default setting for this parameter is *Auto*.

Restricted Role: Toggle between *True* and *False* to set the restricted role state of the packet. If set to *True*, the port will never be selected to be the Root port. The default value is *False*.

Restricted TCN: Toggle between *True* and *False* to set the restricted TCN of the packet. Topology Change Notification (TCN) is a BPDU that a bridge sends out to its root port to signal a topology change. If set to *True*, it stops the port from propagating received TCN and to other ports. The default value is *False*.

Click **Apply** for the settings to take effect. Click **Refresh** to renew the page.

QoS > Storm Control

The Storm Control feature provides the ability to control the receive rate of broadcast, multicast, and unknown unicast packets. Once a packet storm has been detected, the Switch will drop packets coming into the Switch until the storm has subsided.

Figure 58 – QoS > Storm Control

Storm Control Type: User can select the different Storm type from Broadcast Only, Multicast & Broadcast, and Multicast & Broadcast & Unknown Unicast.

Threshold (64Kbps * N): If storm control is enabled (default is disabled), the threshold is from of 64 ~ 1,024,000 Kbit per second, with steps (N) of 64Kbps. N can be from 1 to 16000.

Click **Apply** for the settings to take effect.

QoS > Bandwidth Control

The Bandwidth Control page allows network managers to define the bandwidth settings for a specified port's transmitting and receiving data rates.

Figure 59 – QoS > Bandwidth Control

From Port / To Port: A consecutive group of ports may be configured starting with the selected port.

Type: This drop-down menu allows you to select between *RX* (receive), *TX* (transmit), and *Both*. This setting will determine whether the bandwidth ceiling is applied to receiving, transmitting, or both receiving and transmitting packets.

No Limit: This drop-down menu allows you to specify that the selected port will have no bandwidth limit. *Enabled* disables the limit.

Rate (64-1024000): This field allows you to enter the data rate, in Kbits per second, will be the limit for the selected port. The value is between 64 and 1024000.

Click **Apply** to set the bandwidth control for the selected ports.

QoS > 802.1p/DSCP Priority Settings

QoS is an implementation of the IEEE 802.1p standard that allows network administrators to reserve bandwidth for important functions that require a larger bandwidth or that might have a higher priority, such as VoIP (voice-over Internet Protocol), web browsing applications, file server applications or video conferencing. Thus with larger bandwidth, less critical traffic is limited, and therefore excessive bandwidth can be saved.

The following figure displays the status of Quality of Service priority levels of each port, higher priority means the traffic from this port will be first handled by the switch. For packets that are untagged, the switch will assign the priority depending on your configuration.
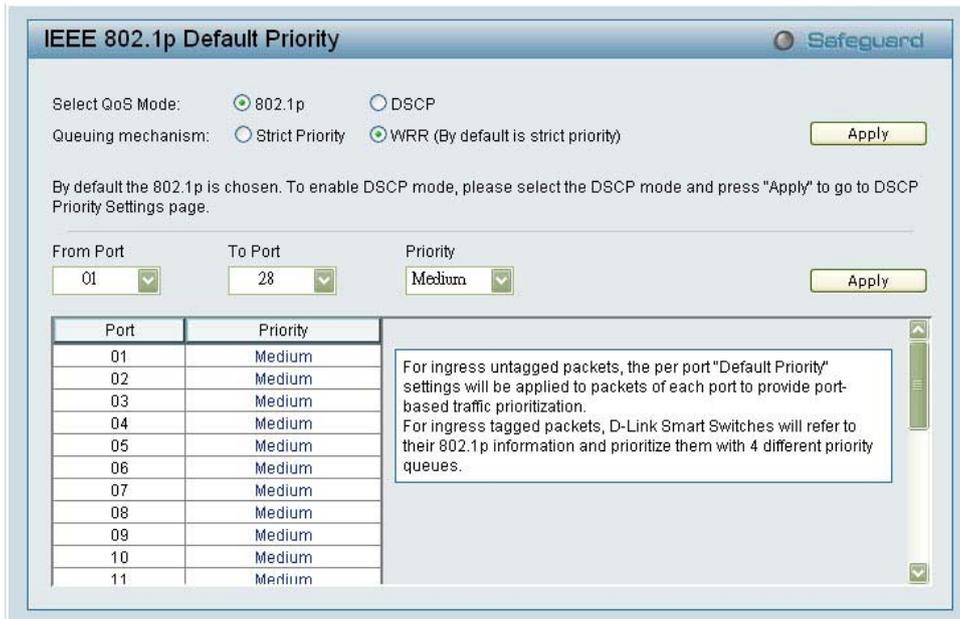

Figure 54 – QoS > 802.1p Default Priority

By selecting the DSCP priority, the web pages will changes as seen below:

Figure 55 – QoS > DSCP Priority Settings

Select QoS Mode: D-Link Smart Switch allows the user to prioritize the traffic based on the 802.1p priority in the VLAN tag or the DSCP (Differentiated Services Code Point) priority in the IP header. Only one mechanism is selected to prioritize the packets at a time.

Queuing Mechanism: Select Strict Priority to process the packets with the highest priority first. Select WRR (Weighted Round-Robin) to process packets according to the weight of each priority. When a priority level has reached its egress weight, the system will process the packets in the next level even if there are remaining packets. D-Link Smart Switch system's weight of priority levels are: 8 (Highest), 4 (High), 2 (Medium) and 1 (Low) packet. By default, the queuing mechanism is **Strict Priority**.

Default Priority: Default is **Medium**. In 802.1p QoS mode, you can use **From Port** / **To Port** to specify the default priority of each port. In DSCP mode, you can configure the global default priority value by using **From DSCP value** / **To DSCP value**.

Security > Trusted Host

Use Trusted Host function to manage the switch from a remote station. You can enter up to ten designated management stations networks by defining the IP address/Subnet Mask as seen in the figure below.

Figure 56 Security > Trusted Host

To define a management station IP setting, click the **Add Host** button and type in the IP address and Subnet mask. Click the **Apply** button to save your settings. You may permit only single or a range of IP addresses by different IP mask setting, the format can be either 192.168.1.1/255.255.255.0 or 192.168.0.1/24. Please see the example below for permitting the IP range

IP Address	Subnet Mask	Permitted IP
192.168.0.1	255.255.255.0	192.168.0.1~192.168.0.255
172.17.5.215	255.0.0.0	172.0.0.1~172.255.255.255

To delete the IP address simply click the **Delete** button, check the unwanted address, and then click **Apply**.

Security > Safeguard Engine

D-Link's **Safeguard Engine** is a robust and innovative technology that automatically throttles the impact of packet flooding into the switch's CPU. This function helps protect the Web-Smart Switch from being interrupted by malicious viruses or worm attacks. This option is enabled by default.
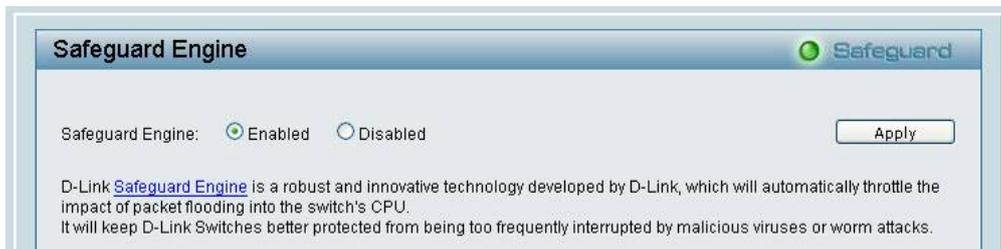

Figure 57 – Security > Safeguard Engine

Security > Port Security

Port Security is a security feature that prevents unauthorized computers (with source MAC addresses) unknown to the Switch prior to stopping auto-learning processing from gaining access to the network.

A given ports' (or a range of ports') dynamic MAC address learning can be stopped such that the current source MAC addresses entered into the MAC address forwarding table can not be changed once the port is enabled. Using the drop-down menu, change **Admin State** to *Enabled*, and then click **Apply** to confirm the setting.

Figure 58 – Security > Port Security

Security > 802.1X > 802.1X Settings

Network switches provide easy and open access to resources by simply attaching a client PC. Unfortunately this automatic configuration also allows unauthorized personnel to easily intrude and possibly gain access to sensitive data.

IEEE-802.1X provides a security standard for network access control, especially in Wi-Fi wireless networks. 802.1X holds a network port disconnected until authentication is completed. The switch uses Extensible Authentication Protocol over LANs (EAPOL) to exchange authentication protocol client identity (such as a user name) with the client, and forward it to another remote RADIUS authentication server to verify access rights. The EAP packet from the RADIUS server also contains the authentication method to be used. The client can reject the authentication method and request another, depending on the configuration of the client software and the RADIUS server. Depending on the authenticated results, the port is either made available to the user, or the user is denied access to the network.

The RADIUS servers make the network a lot easier to manage for the administrator by gathering and storing the user lists.

Figure 59 – Security > 802.1X > 802.1X Setting

By default, 802.1X is disabled. To use EAP for security, select enabled and set the 802.1X **Global Settings** for the Radius Server and applicable authentication information.

RADIUS Server IP: The IP address of the external Radius Server. You need to specify an RADIUS server to enable 802.1X authentication.

Key: Masked password matching the Radius Server Key. The max. length is 32 characters.

Confirm Key: Enter the Key a second time for confirmation.

TxPeriod (1 – 65535 sec): This sets the TxPeriod of time for the authenticator PAE state machine. This value determines the period of an EAP Request/Identity packet transmitted to the client. Default is 24 seconds.

ReAuthEnabled: This function is to determine whether regular re-authentication will take place on this port(s). When the 802.1X function is enabled, the switch sends an EAP-request/identity packet to client. The ReAuthEnabled function is by default disabled.

QuietPeriod (0 – 65535 sec): Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. Default is 80 seconds

SuppTimeout (1 – 65535 sec): This value determines timeout conditions in the exchanges between the Authenticator and the client. Default is 12 seconds.

ServerTimeout (1 – 65535 sec): Sets the amount of time the switch waits for a response from the client before resending the response to the authentication server. Default is 16 seconds.

MaxReq (1 – 10): This parameter specifies the maximum number of times that the switch retransmits an EAP request (md-5challnege) to the client before it times out the authentication session. Default is 5 times.

ReAuthPeriod (1 – 4294967295 sec): This command affects the behavior of the switch only if periodic re-authentication is enabled. Default is 3600.

To establish 802.1X port-specific assignments, select the **From Ports** / **To Ports** and select **Enable**.

802.1X Port Access Control: Three type of Port Access Control State can be "**Force Authorized**", "**Force UnAuthorized**", and "**Auto**".

Select **Force Authorized** to disable 802.1X and cause the port to transition to the authorized state without any authentication exchange required. This means the port transmits and receives normal traffic without 802.1X-based authentication of the client.

If **Force Unauthorized** is selected, the port will remain in the unauthorized state ignoring all attempts by the client to authenticate. The Switch cannot provide authentication services to the client through the interface.

If **Auto** is selected, it will enable 802.1X and cause the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port transitions from down to up, or when an EAPOL-start frame is received. The Switch then requests the identity of the client and begins relaying authentication messages between the client and the authentication server.

The default setting is **Auto**.

Security > MAC Address Table > Static MAC

This feature provides two distinct functions. The **Disable Auto Learning** table allows turning off the function of learning MAC address automatically, if a port isn't specified as an uplink port (for example, connects to a DHCP Server or Gateway). By default, this feature is Off (disabled).

Figure 60 – Security > Static Mac Address

To initiate the removal of auto-learning for any of the uplink ports, click **On** to enable this feature, and then select the port(s) for auto learning to be disabled.

The **Static MAC Address Setting** table displays the static MAC addresses connected, as well as the VID. Click **Add Mac** to add a new MAC address, you also need to select the assigned Port number, enter both the Mac Address and VID and Click **Apply**. Click **Delete** to remove one entry or click **Delete all** to clear the list. You can also copy a learned MAC address from **Dynamic Forwarding Table** (please refer to **Security > MAC Address Table > Dynamic Forwarding Table** for details).

By disabling Auto Learning capability and specify the static MAC addresses, the network is protected from potential threats like hackers because traffic from illegal MAC addresses will not be forwarded by the Switch.

Security > MAC Address Table > Dynamic Forwarding Table

For each port, this table displays the MAC address learned by the Switch. To add a MAC address to the Static Mac Address List, click the **Add** checkbox, and then click **Apply** associated with the identified address.

Figure 61 – Security > Dynamic Forwarding Table

Monitoring > Statistics

The Statistics screen displays the status of each port packet count.

Figure 62 – Monitoring > Statistics

Refresh All: Renews the details collected and displayed.

Clear All Counters: To reset the details displayed.

TxOK: Number of packets transmitted successfully.

RxOK: Number of packets received successfully.

TxError: Number of transmitted packets resulting in error.

RxError: Number of received packets resulting in error.

To view the statistics of individual ports, click one of the linked port numbers for details.

Figure 63 – Monitoring > Port Statistics

Previous Page: Go back to the Statistics main page.
Refresh: To renew the details collected and displayed.
Clear Counter: To reset the details displayed.

Monitoring > Cable Diagnostics

The Cable Diagnostics is designed primarily for administrators and customer service representatives to examine of the copper cable quality. It rapidly determines the type of cable errors occurred in the cable.

Select a port and then click the **Test Now** button to start the diagnosis.

Figure 64 – Monitoring > Cable Diagnostic

Test Result: The description of the cable diagnostic results.

 • **OK** means the cable is good for the connection.

 • **Short in Cable** means the wires of the RJ45 cable may be in contact somewhere.

 • **Open in Cable** means the wires of RJ45 cable may be broken or the other end of the cable is simply disconnected.

 • **Test Failed** means some other errors occurred during cable diagnostics. Please select the same port and test again.

Cable Fault Distance (meters): Indicates the distance of the cable fault from the Switch port, if the cable is less than 2 meters, it will show "No Cable".

Cable Length (meter): If the test result shows OK, then cable length will be indicated for the total length of the cable. The cable lengths are categorized into four types: <50 meters, 50~80 meters, 80~100 meters and >100 meters.

> **NOTE:** Cable length detection is effective on Gigabit ports only.

Monitoring > System Log

The System Log page provides information about system logs, including information when the device was booted, how the ports are operating, when users logged in, when sessions timed out, as well as other system information.

Figure 65 – Monitoring > System Log

ID: Displays an incremented counter of the System Log entry. The Maximum entries are 500.

Time: Displays the time in days, hours, and minutes the log was entered.

Log Description: Displays a description event recorded.

Severity: Displays a severity level of the event recorded.

Click **Refresh** to renew the page, and click **Clear** to clean out all log entries.

<u>**ACL > ACL Configuration Wizard**</u>

Access Control List (ACL) allows you to establish criteria to determine whether or not the Switch will forward packets based on the information contained in each packet's header. These criteria can be specified on a basis of MAC address, or IP address.

The ACL Configuration Wizard will aid with the creation of access profiles and ACL Rules. The ACL Wizard will create the access rule and profile automatically. The maximum usable profiles are 50 and with 240 Rules in total for the switch.

Figure 66 – ACL > ACL Configuration Wizard

From: Specify the origin of accessible packets. The possible values are:

    Any - Indicates ACL action will be on packets from any source.

    MAC Address - Indicates ACL action will be on packets from this MAC address.

    IPv4 Addresses - Indicates ACL action will be on packets from this IPv4 source address.

To: Specify the destination of accessible packets. The possible values are:

    Any - Indicates ACL action will be on packets from any source.

    MAC Address - Indicates ACL action will be on packets from this MAC address. The field of format is xx-xx-xx-xx-xx-xx.

    IPv4 Addresses - Indicates ACL action will be on packets from this IPv4 source address.

Service Type: Specify the type of service. The possible values are:

Any - Indicates ACL action will be on packets from any service type.

> **Ether type** - Specifies an Ethernet type for filtering packets.
>
> **ICMP All** - Indicates ACL action will be on packets from ICMP packets.
>
> **IGMP** - IGMP packets can be filtered by IGMP message type.
>
> **TCP All** - Indicates ACL action will be on packets from TCP Packets.
>
> **TCP Source Port** - Matches the packet to the TCP Source Port.
>
> **TCP Destination Port** - Matches the packet to the TCP Destination Port.
>
> **UDP All** - Indicates ACL action will be on packets from UDP Packets.
>
> **UDP Source Port** - Matches the packet to the UDP Source Port.
>
> **UDP Destination Port** - Matches the packet to the UDP Destination Port.

Action: Specify the ACL forwarding action matching the rule criteria. *Permit* is to forward packets if all other ACL criteria are met. Deny is to drop packets if all other ACL criteria is met.

Port: Enter a range of ports to be configured.

Press **Apply** for the settings to take effect.

> **NOTE:** Once the ACL rules conflict, rules with smaller rule ID will take higher priority.

> **NOTE:** Be careful when configuring ACL rules, an inappropriate may cause management access failed.

ACL > ACL Profile List

The ACL Profile List provides information for configuring ACL Profiles manually. ACL profiles are attached to interfaces, and define how packets are forwarded if they match the ACL criteria.

Figure 67 – ACL > ACL Profile List

The contents of Access Profile List table include:

Profile ID: Indicates the profile Identification number. The possible configured profile IDs are 1~50, and profile ID 51 is reserved for Voice VLAN.

Owner Type: The owner type of ACL profile; it can be normal ACL or Voice VLAN.

Profile Summary: Displays the profile summary.

Show Details: To display an ACL's profile details. The ACL profile details are displayed below the ACL table.

Show Rules: To show the access rule in this profile.

Edit / New Rules: To edit or create an access rule in this profile. To add a new rule, please see **Access Rule List** in the next section.

Delete: To delete an access profile.

To manually add a profile, click **Add ACL Profile**:

Figure 68 – Add Access Profile

The steps of adding an access profile is like below:

1) After selecting the **Profile ID** and **Frame Type** (MAC or IPv4), specify attributes like Untagged/Tagged (for MAC), or ICMP/IGMP/TCP/UDP (for IPv4), then click *Select* and a simplified frame diagram will be displayed.

2) Select the field of interest and related columns will be displayed in lower part of the page. Enter the filtering mask and click **Create** when done. A filtering mask is to specify the digit that you want to check. For example, if you want to check a network of 192.168.1.0/24, then you should enter the IP mask as 255.255.255.0.

> **NOTE:** You cannot select Payload in a MAC ACL, or L2 Header in IP ACL.

3) After the **Profile ID** has been created, it will go back to the main Access Profile List page, clicking the **Edit / New Rules** button to enter **Access Rule List** page.

Figure 69 – Access Rule List

Profile ID: Indicates the corresponding access profile Identification number.

Access ID: Indicates the access rule Identification number.

Profile Type: Displays the profile type.

Summary: Displays the access rule summary.

Action: Displays the access rule action.

To add a new rule, click **Add Rule**:

Figure 70 – Add Access Rule

Profile Information displays the information to which the rule is being added to, including **Profile ID** and other fields specified.

In **Rule Detail**, you can specify the details of an access rule. Below is all the possible parameters can be set.

Access ID: Specify the Access ID (1-65535).

Type: Display the type of rule.

VLAN ID: The VLAN ID for a previously configured VLAN.

Destination MAC Address: Specify the Destination MAC address, the field of format is xx-xx-xx-xx-xx-xx.

Source MAC Address: Specify the Source MAC address, the field of format is xx-xx-xx-xx-xx-xx.

802.1p: Specify the 802.1p priority value.

Ether Type: Specify the Ethernet Type value.

Destination IP Address: Specify the Destination IP address.

Source IP Address: Specify the Source IP address.

DSCP: Specify the DSCP value.

IP Protocol: The L4 protocol above IP. Possible values are ICMP, IGMP, TCP, and UDP.

ICMP Type: Specify the ICMP packet type.

ICMP Code: Specify the ICMP packet Code.

IGMP Type: Specify the IGMP packet type.

Source Port: Specify the TCP or UDP source port value.

Destination Port: Specify the TCP or UDP destination port value.

TCP Flag: Specify the TCP flag value.

Ports: Specify the switch ports that you want to implement the access rule to.

Action: Specify the ACL forwarding action matching the rule criteria. **Permit** is to forward packets if all other ACL criteria are met. Deny is to drop packets if all other ACL criteria is met.

Click **Apply** to make it effective.

> **NOTE:** The switch proceeds the access rule from the smallest access ID, so be careful in assigning the ID for the expected results.

To modify an existing rule, please click on the Access ID hyperlink.

Figure 71 – ACL > Access Profile List > Access Rule List

ACL > ACL Finder

This page is used to help find a previously configured ACL entry. To search for an entry, enter the profile ID from the drop-down menu, select a port that you wish to view, define the state and click **Find.** The table on the lower half of the screen will display the entries. To delete an entry click the corresponding **Delete** button.

Figure 72 – ACL > ACL Finder

6 Command Line Interface

The D-Link Web Smart Switch allows a computer or terminal to perform some basic monitoring and configuration tasks by using the Command Line Interface (CLI) via TELNET protocol.

To connect a switch via TELNET:

1. Make sure the network connection between the switch and PC is active.

2. To connect, launch any terminal software like *HyperTerminal* in Microsoft Windows, or just use the command prompt by typing the command *telnet* followed by the switch IP address, eg. *telnet 10.90.90.90*.

3. The logon prompt will appear.

Logging on to the Command Line Interface:

Enter your User Name and Password to log in. The default user name and password is **admin**. Note that the user name and password are case-sensitive. Press **Enter** in both the Username and Password fields. The command prompt will appear as shown below (**DES-1210-28>):**

```
DES-1210-28 login: admin
Password:

DES-1210-28>
```

Figure 73 – Command Prompt

The user session is automatically terminated if idle for the login timeout period. The default login timeout period is 5 minutes. To change the login timeout session please refers to chapter 5.

CLI Commands:

There are a number of helpful features included in the CLI. Enter the **?** command will display a list of commands.

```
DES-1210-28>
?
USEREXEC commands :
  config account admin password <passwd>
  config ipif System { ipaddress <ip-address> <subnet-mask> gateway <gw-address>
 | dhcp }
  download { firmware_fromTFTP tftp://ip-address/filename | cfg_fromTFTP tftp://
ip-address/filename }
  logout
  ping <ipaddr>
  reboot
  reset config
  save
  show ipif
  show switch
  upload { firmware_toTFTP tftp://ip-address/filename | cfg_toTFTP tftp://ip-add
ress/filename }
```

Figure 74 – The ? Command

Download

The **download** command is used to download and install new firmware or a Switch configuration file from a TFTP server.

Syntax

download { firmware_fromTFTP tftp://ip-address/filename | cfg_fromTFTP tftp://ip-address/filename}

Parameters

Parameter	Description
firmware_fromTFTP	Download and install new firmware on the Switch from a TFTP server.

cfg_fromTFTP	Download a switch configuration file from a TFTP server.
tftp://ip-address/	The IP address of the TFTP server.
filename	The filename of the firmware or switch configuration file on the TFTP server. You need to specify the DOS path if the file is not at the root directory of the TFTP server.

Upload

The **upload** command is used to upload the firmware file or a Switch configuration file to a TFTP server.

Syntax
upload { firmware_toTFTP tftp://ip-address/filename | cfg_toTFTP tftp://ip-address/filename }

Parameters

Parameter	Description
firmware_toTFTP	Upload the firmware on the Switch from a TFTP server.
cfg_toTFTP	Specifies that the Switch's current settings will be uploaded to the TFTP server.
tftp://ip-address/	The IP address of the TFTP server.
filename	The filename of the firmware or switch configuration file on the TFTP server. You need to specify the DOS path if the file is not at the root directory of the TFTP server.

Config ipif System

The **config ipif System** command sets the IP address of the switch.

Syntax
config ipif System { ipaddress <ip-address> <subnet-mask> gateway <gw-address> | dhcp }

Parameter

Parameter	Description
ipaddress <ip-address> <subnet-mask>	The IP address and subnet mask to be created. Users need to specify the address and mask information using the traditional format (for example,10.1.2.3/255.0.0.0).
gateway <gw-address>	The IP address of the router or gateway.
dhcp	Allows the selection of the DHCP protocol for the assignment of an IP address to the Switch's System IP interface.

Logout

This command closes the current connection.

Syntax
logout

NOTE: Save your configuration changes before

logging out.

Ping

This command checks if another computer is on the network and listens for connections. You can ping the switch from any IP workstation the switch is connected to through the managed VLAN (VLAN 1 by default), as long as there is a physical path between the switch and the workstation. The terminal interface sends five pings to the target station.

Syntax

ping <ipaddr>

Parameter

Parameter	Description
<ipaddr>	The IP address of the target station.

Reboot

This command reboots the system. All network connections are terminated and the boot code executes.

Syntax

reboot

Reset

All configurations will be reset to the default settings.

Syntax

reset config

Show ipif

The command displays the current IP address of the switch.

Syntax

show ipif

Example

```
DES-1210-28> sh ipif
IP Setting Mode              : Static
IP Address                   : 10.90.90.90
Subnet Mask                  : 255.0.0.0
Default Gateway              : 0.0.0.0
```

Figure 75 – The show ipif Command

Show switch

The command displays the status of the switch.

Syntax

show switch

Example

```
DES-1210-28> show switch
System name                       :
System Contact                    :
System Location                   :
System up time                    : 3 hrs, 20 min, 44 secs
System Time                       : 01/01/2009 03:24:32
System hardware version           : A1
System firmware version           : 1.00.006
System boot version               : 1.00.000
System Protocol version           : 2.001.004
System serial number              : LABDES12280D7
MAC Address                       : 00-12-28-00-D7-00
```

Figure 76 – The show switch Command

Config account admin password

The command sets the administrator password.

Syntax

config account admin password <passwd>

Parameter

Parameter	Description
<passwd>	The new password of the administrator.

Save

The command saves the configuration changes to the memory.

Syntax

save

Example

```
DES-1210-28> save
Building configuration ...
[OK]
```

Figure 77 – The save Command

Appendix A - Ethernet Technology

This chapter will describe the features of the D-Link Web Smart Switch and provide some background information about Ethernet/Fast Ethernet/Gigabit Ethernet switching technology.

Gigabit Ethernet Technology

Gigabit Ethernet is an extension of IEEE 802.3 Ethernet utilizing the same packet structure, format, and support for CSMA/CD protocol, full duplex, and management objects, but with a tenfold increase in theoretical throughput of over 100-Mbps Fast Ethernet and a hundredfold increase over 10-Mbps Ethernet. Since it is compatible with all 10-Mbps and 100-Mbps Ethernet environments, Gigabit Ethernet provides a straightforward upgrade without wasting existing investments in hardware, software, or trained personnel.

The increased speed and extra bandwidth offered by Gigabit Ethernet is essential to help solving network bottlenecks that frequently develop as more advanced computer users and newer applications continue to demand greater network resources. Upgrading key components, such as backbone connections and servers to Gigabit Ethernet technology can greatly improve network response times as well as significantly speed up the traffic between subnets.

Gigabit Ethernet enables fast optical fiber connections to support video conferencing, complex imaging, and similar data-intensive applications. Likewise, since data transfers occur 10 times faster than Fast Ethernet, servers outfitted with Gigabit Ethernet NIC's are able to perform 10 times the number of operations in the same amount of time.

In addition, the phenomenal bandwidth delivered by Gigabit Ethernet is the most cost-effective method to take advantage of today and tomorrow's rapidly improving switching and routing internetworking technologies. And with expected advances in the coming years in silicon technology and digital signal processing that will enable Gigabit Ethernet to eventually operate over unshielded twisted-pair (UTP) cabling, outfitting your network with a powerful 1000-Mbps-capable backbone/server connection which will create a flexible foundation for the next generation of network technology products.

Fast Ethernet Technology

The growing importance of LANs and the increasing complexity of desktop computing applications are fueling the need for high performance networks. A number of high-speed LAN technologies have been proposed to provide greater bandwidth and improve client/server response times. Among them, 100BASE-T (Fast Ethernet) provides a non-disruptive, smooth evolution from the current 10BASE-T technology. The non-disruptive and smooth evolution nature, and the dominating potential market base, virtually guarantees cost-effective and high performance Fast Ethernet solutions.

100Mbps Fast Ethernet is a standard specified by the IEEE 802.3 LAN committee. It is an extension of the 10Mbps Ethernet standard with the ability to transmit and receive data at 100Mbps, while maintaining the CSMA/CD Ethernet protocol. Since the 100Mbps Fast Ethernet is compatible with all other 10Mbps Ethernet environments, it provides a straightforward upgrade and utilizes existing investments in hardware, software, and personnel training.

Switching Technology

Another approach to push beyond the limits of Ethernet technology is the development of switching technology. A switch bridges Ethernet packets at the MAC address level of the Ethernet protocol transmitting among connected Ethernet or Fast Ethernet LAN segments.

Switching is a cost-effective way of increasing the total network capacity available to users on a local area network. A switch increases capacity and decreases network loading by dividing a local area network into different segments which won't compete with each other for network transmission capacity.

The switch acts as a high-speed selective bridge between the individual segments. The switch, without interfering with any other segments, automatically forwards traffic that needs to go from one segment to another. By doing this the total network capacity is multiplied, while still maintaining the same network cabling and adapter cards.

Appendix B - Technical Specifications

Hardware Specifications

Key Components / Performance

- Switching Capacity:
  - DES-1210-28: 12.8Gbps
  - DES-1210-52: 17.6Gbps
- Max. Forwarding Rate
  - DES-1210-28: 9.5Mpps
  - DES-1210-52: 13.1Mpps
- Forwarding Mode: Store and Forward
- Packet Buffer memory: 256K Bytes
- DDRII for CPU: 64M Bytes
- Flash Memory: 16M Bytes

Port Functions

- 24 10/100BaseT ports compliant with the following standards:
  - IEEE 802.3
  - IEEE 802.3u
  - Supports Full-Duplex operations
- 4 1000Base-T ports compliant with the following standards:
  - IEEE 802.3
  - IEEE 802.3u
  - IEEE 802.3ab
  - Supports Full-Duplex operations
- 2 combo SFP ports compliant with the following standards:
  - IEEE 802.3z
  - Supports Full-Duplex operations
- SFP transceivers supported
  - DEM-310GT (1000BASE-LX, 10km)
  - DEM-311GT (1000BASE-SX, 550m)
  - DEM-314GT (1000BASE-LH, 50km)
  - DEM-315GT (1000BASE-ZX, 80km)
  - DEM-312GT2 (1000BASE-SX, 2km)
  - DEM-210 (100BASE-FX, 15km)
  - DEM-211 (100BASE-FX, 2km)
  - WDM Transceivers Supported:
  - DEM-330T (1000Base-BX,TX-1550/RX-1310nm, 10km)
  - DEM-330R (1000Base-BX,TX-1310/RX-1550nm, 10km)
  - DEM-331T (1000Base-BX,TX-1550/RX-1310nm, 40km)
  - DEM-331R (1000Base-BX,TX-1310/RX-1550nm, 40km)
  - DEM-220T (100Base-BX, TX-1550/RX-1310nm, 20km)

- DEM-220R (100Base-BX, TX-1310/RX-1550nm, 20km)

Physical & Environment

- AC input, 100~240 VAC, 50/60Hz, internal universal power supply
- Acoustic Value:
  - DES-1210-28/52: 0dB (Fan-less)
- Operation Temperature 0~40°C
- Storage Temperature -10~70°C
- Operation Humidity: 10%~95% RH
- Storage Humidity: 5%~95% RH

Emission (EMI) Certifications

- FCC class A
- CE Class A
- VCCI Class A

Safety Certifications

- cUL, LVD

Features

L2 Features

- Supports up to 8K MAC address
- IGMP snooping: supports 256 multicast group
- 802.1D Spanning Tree
- 802.1w Rapid Spanning Tree
- Loopback Detection
- 802.3ad Link Aggregation: up to 8 groups per device, up to 8 ports per group
- Port mirroring

VLAN

- 802.1Q VLAN standard (VLAN Tagging)
- Up to 256 static VLAN groups
- Asymmetric VLAN
- Management VLAN
- Auto-Voice VLAN

QoS (Quality of Service)

- 802.1p priority, DSCP priority queue mapping
- Up to 4 queues per port
- Supports Strict / WRR mode in queue handling
- Bandwidth Control

Security

- 802.1X port-based access control
- Port Security
- IP and MAC ACL

- Broadcast Storm Control
- D-Link Safeguard Engine
- Trusted Host

<u>Management</u>
- Web-based GUI or SmartConsole Utility
- D-Link proprietary CLI
- SNMP support
- DHCP client
- Trap setting for destination IP, system events, fiber port events, twisted-pair port events
- Port access control
- Web-based configuration backup / restoration
- Web-based firmware backup/restore
- Firmware upgrade using SmartConsole Utility & Web-based management
- Reset, Reboot

Appendix C – Rack mount Instructions

Safety Instructions - Rack Mount Instructions - The following or similar rack-mount instructions are included with the installation instructions:

A) Elevated Operating Ambient - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature (Tma) specified by the manufacturer.

B) Reduced Air Flow - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

C) Mechanical Loading - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

D) Circuit Overloading - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

E) Reliable Earthing - Reliable earthing of rack-mounted equipment should be maintained. Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips).
