General Information

The D-Link DSL-2640U is an ADSL2+ router that provides a convenient wireless routing function. This user manual offers you with a simple and easy-to-understand format to install and configure your router.

Package Contents

Included in the package is one of each of the following—

- DSL-2640U Wireless ADSL2/2+ 4-port Ethernet Router
- Power adapter
- RJ-11 telephone cable
- RJ-45 Ethernet cable
- CD-ROM (*containing User Manual & Quick Guide*)
- Quick Guide (*booklet*)

Important Safety Instructions

- Place your router on a flat surface close to the cables in a location with sufficient ventilation. Do not mount this device on a wall.
- To prevent overheating, do not obstruct the ventilation openings of this equipment.
- Plug this equipment into a surge protector to reduce the risk of damage from power surges and lightning strikes.
- Operate this equipment only from an electrical outlet with the correct power source as indicated on the adapter.
- Do not open the cover of this equipment. Opening the cover will void any warranties on the equipment.
- Unplug equipment first before cleaning. A damp cloth can be used to clean the equipment. Do not use liquid / aerosol cleaners or magnetic / static cleaning devices.

Front Panel View

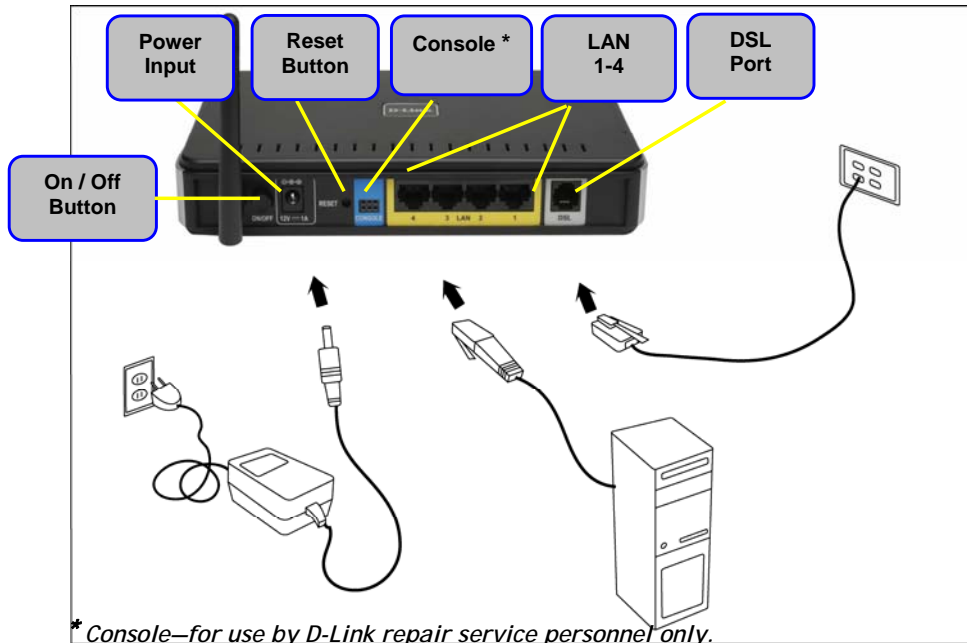

LED	Mode	Indication
Power	Solid Green	The router is powered on. (READY)
	No light	The power is off.
	Red	Failure or device malfunction. (NOT READY)
Status	Flashing Green	Traffic is passing through the device. (INTERNET TRAFFIC)
DSL	Solid Green	DSL is synchronized.
	No Light	No carrier signal.
	Slow Flashing	DSL attempting synch. Trying to detect carrier signal.
WLAN	Fast Flashing	Carrier has been detected and router is trying to train.
	Solid Green	Wireless is up.
	Flashing	Wireless traffic is passing through.
LAN 1-4	No Light	Wireless is down.
	Solid Green	Powered device connected to associated port
	Flashing Green	LAN activity present (traffic in either direction).
Internet	No Light	No activity, router power off, no cable or no powered device is connected to the LAN port.
	Solid Green	IP connected (device has a WAN IP address from IPCP or DHCP and DSL is up or a static IP address is configured, PPP negotiation has completed successfully (if used), and DSL is up. (WAN IP AVAILABLE)
	Red	Device attempted to become IP connected and failed (no DHCP response, no PPPoE response, PPPoE authentication failed, no IP address from IPCP, etc.). (WAN IP NOT AVAILABLE)

Back Panel View

Port	Description
On/ Off	Press to turn the router on and off.
Power	Connects to the power adapter.
Reset	Press for less than 3 seconds to reset the router. Press for 3 seconds or more to revert to factory settings.
Console	For use by D-Link service personnel for maintenance purposes only.
LAN 4-1	RJ-45 connects the unit to Ethernet devices such as a PC or a switch.
DSL	RJ-11 telephone port connects telephone cable to telephone or fax machine.

Connecting the Router to Your Computer

Connect the Telephone Cable

- Connect one end of the telephone cable to the **DSL port** on the router and the other end of the cable into the wall socket.

Connect the Ethernet Cable

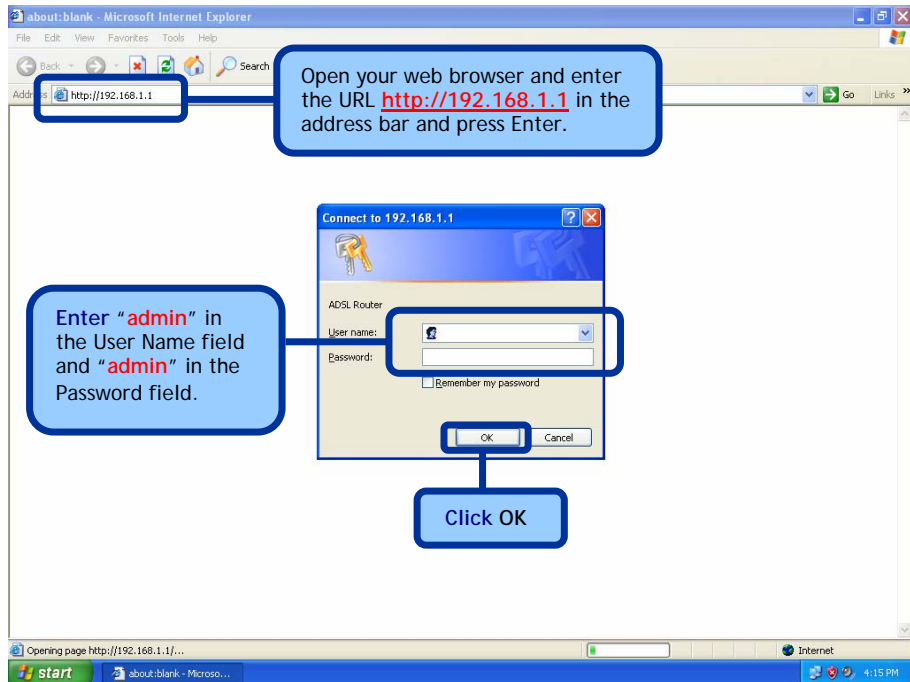

- Connect one end of the Ethernet cable to one of the 4 **LAN ports** on the back of the router and attach the other end to an Ethernet Adapter or available Ethernet port on your computer. Or, you can attach it to a switch / hub first and connect your computer to the switch / hub.

Connect the Power Adapter

- Complete the process by connecting the power adapter to the **Power input** on the back of the router and then plug the other end of power adapter into a wall outlet or power strip. Then turn on the router and boot up your PC and any LAN devices, such as hubs or switches, and any computers connected to them.

Configuring the Router

To use your web browser to access the web pages used to set up the router, your computer must be configured to “Obtain an IP address automatically”, that is, you must change the IP network settings of your computer so that it is a DHCP client. If you are using Windows XP and do not know how to change your network settings, skip ahead to **Appendix A** and read the instructions provided.

NOTE: Actually, there are two default user name and password combinations. The **user / user** name and password combination provides limited access to certain configurations. The **admin / admin** combination can perform all functions. Passwords can be changed at any time.

Home

The home section provides configurations for general use, including a Quick Setup Wizard with steps to quickly set up your router for Internet connection. Also included in this section are LAN / WAN setup and DNS configuration. The below sections explain the setup for each.

Wizard

This section will explain how to quickly configure the router if your only intention is to access the Internet.

ATM PVC Configuration

To enable the auto-connect process, click on the box labeled DSL Auto-connect, a process that will automatically detect the first usable PVC and automatically detect PPPoE and PPPoA. To continue, click on the Next button.

Skip ahead to page 11 if you select *DSL Auto-connect*.

If you uncheck the *DSL Auto-connect* box, the resulting screen is seen below. Enter the VPI / VCI as indicated by your ISP. Also shown will be the Quality of Service.

Wizard

This Quick Setup will guide you through the steps necessary to configure your DSL Router.

ATM PVC Configuration.

Select the check box below to enable DSL Auto-connect process.

DSL Auto-connect

The Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) are needed for setting up the ATM PVC. Do not change VPI and VCI numbers unless your ISP instructs you otherwise.

VPI: [0-255]

VCI: [32-65535]

Enable Quality Of Service

Enabling QoS for a PVC improves performance for selected classes of applications. However, since QoS also consumes system resources, the number of PVCs will be reduced consequently. Use **Advanced Setup/Quality of Service** to assign priorities for the applications.

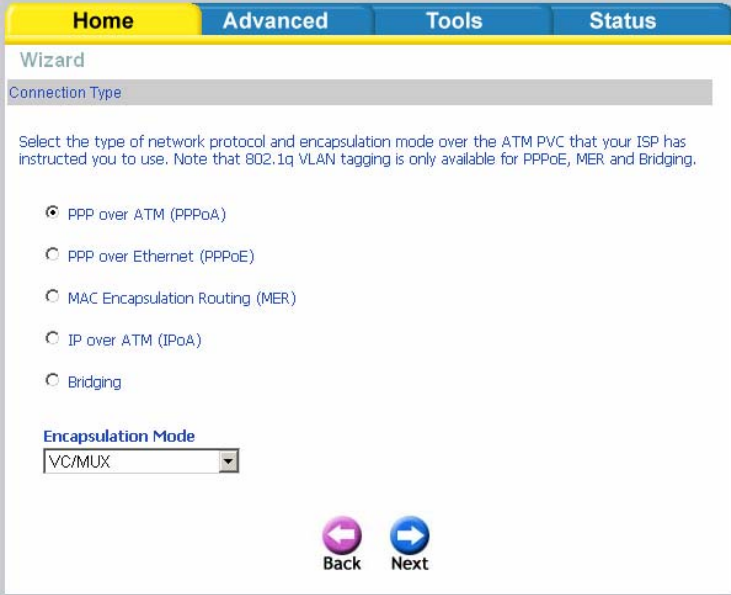

Enable Quality Of Service

Connection Type

Following is the Connection Type screen where you select the type of network protocol and encapsulation mode over the ATM PVC that your ISP has instructed you to use.

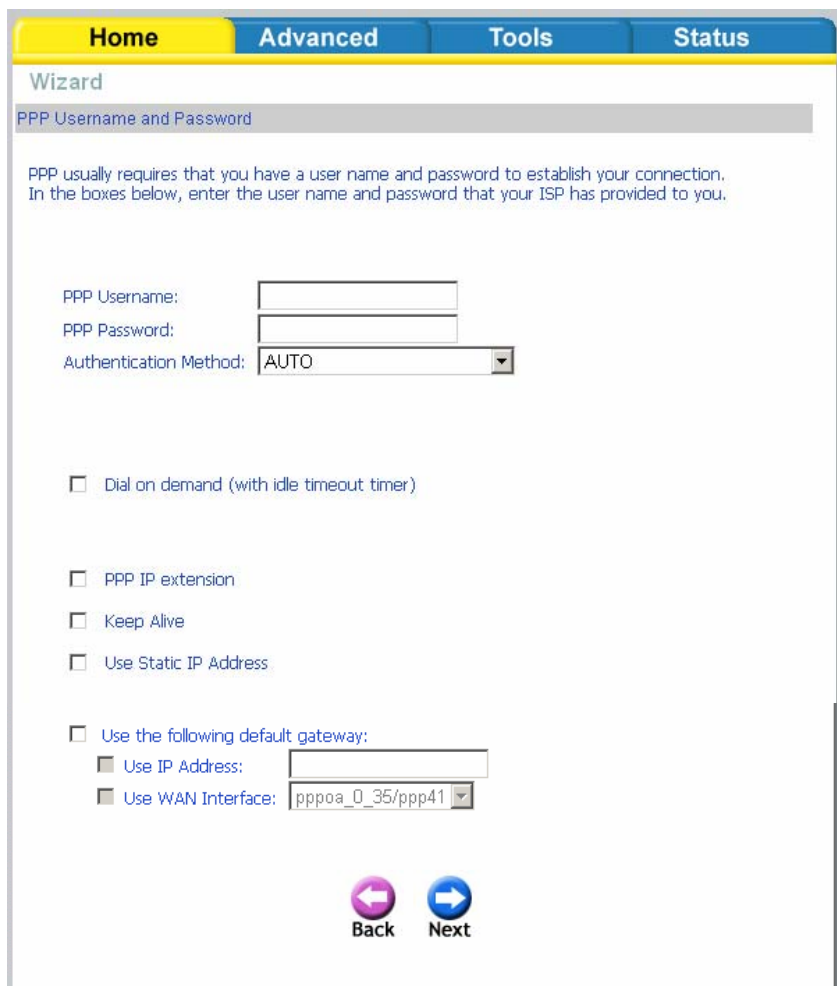

The following is a PPPoA example. Click on Next to continue.

The screenshot shows a web-based wizard interface with a navigation bar at the top containing 'Home', 'Advanced', 'Tools', and 'Status'. The 'Home' tab is active. Below the navigation bar, the page is titled 'Wizard' and 'Connection Type'. A descriptive text block states: 'Select the type of network protocol and encapsulation mode over the ATM PVC that your ISP has instructed you to use. Note that 802.1q VLAN tagging is only available for PPPoE, MER and Bridging.' Below this text are five radio button options: 'PPP over ATM (PPPoA)' (selected), 'PPP over Ethernet (PPPoE)', 'MAC Encapsulation Routing (MER)', 'IP over ATM (IPoA)', and 'Bridging'. Underneath the radio buttons is a section titled 'Encapsulation Mode' with a dropdown menu currently showing 'VC/MUX'. At the bottom of the form are two circular buttons: a pink 'Back' button and a blue 'Next' button.

PPP Username and Password

Now, enter the PPP username and password as given by your ISP. Then decide if you will be using any features such as *Dial on demand*, *PPP IP extension*, *Keep Alive* and then click on **Next**.

The screenshot shows a web-based configuration wizard with a navigation bar at the top containing 'Home', 'Advanced', 'Tools', and 'Status'. The 'Advanced' tab is selected. The main content area is titled 'Wizard' and 'PPP Username and Password'. It contains the following fields and options:

- PPP Username: [text input field]
- PPP Password: [text input field]
- Authentication Method: [dropdown menu showing 'AUTO']
- Dial on demand (with idle timeout timer)
- PPP IP extension
- Keep Alive
- Use Static IP Address
- Use the following default gateway:
 - Use IP Address: [text input field]
 - Use WAN Interface: [dropdown menu showing 'pppoe_0_35/ppp41']

At the bottom of the form are two buttons: 'Back' (with a left-pointing arrow) and 'Next' (with a right-pointing arrow).

Network Address Translation Settings

The next step is to configure the Network Address Translation (NAT) settings. For the example, NAT will be enabled. The remaining fields are left as default and then click on **Next** to continue.

Home **Advanced** **Tools** **Status**

Wizard

Network Address Translation Settings

Network Address Translation (NAT) allows you to share one Wide Area Network (WAN) IP address for multiple computers on your Local Area Network (LAN).

Enable NAT

Enable Firewall

Enable IGMP Multicast, and WAN Service

Enable IGMP Multicast

Enable WAN Service

Service Name:

Back **Next**

Device Setup

You can configure the DSL Router IP address and Subnet Mask for the LAN interface to correspond to your LAN's IP Subnet. If you want the DHCP server to automatically assign IP addresses, then enable the DHCP server and enter the range of IP addresses that the DHCP server can assign to your computers. Disable the DHCP server if you would like to manually assign IP addresses. Click on Next to continue.

Home	Advanced	Tools	Status
<p>Wizard</p> <p>Device Setup</p> <p>Configure the DSL Router IP Address and Subnet Mask for LAN interface.</p> <p>IP Address: <input type="text" value="192.168.1.1"/></p> <p>Subnet Mask: <input type="text" value="255.255.255.0"/></p> <p> <input type="radio"/> Disable DHCP Server <input checked="" type="radio"/> Enable DHCP Server </p> <p>Start IP Address: <input type="text" value="192.168.1.2"/></p> <p>End IP Address: <input type="text" value="192.168.1.254"/></p> <p>Leased Time (hour): <input type="text" value="24"/></p> <p><input type="checkbox"/> Configure the second IP Address and Subnet Mask for LAN interface</p> <p style="text-align: center;">   </p>			

Wireless

The router's wireless function can be enabled on the following screen. If the function is enabled, then continue by entering the SSID, the wireless network name. Click on Next to continue.

Home	Advanced	Tools	Status
<p>Wizard</p> <p>Wireless</p> <p>Enable Wireless <input checked="" type="checkbox"/></p> <p>Enter the wireless network name (also known as SSID).</p> <p>SSID: <input type="text" value="Wireless"/></p> <p style="text-align: center;">   </p>			

Setup - Summary

After all of the configurations are done, the *WAN Setup Summary* screen displays all WAN settings that you have made. Check that the settings are correct before clicking on the **Save / Reboot** button. Clicking on **Save / Reboot** will save your settings and restart your router.

Home **Advanced** **Tools** **Status**

Wizard

Setup - Summary

Make sure that the settings below match the settings provided by your ISP.

VPI / VCI:	0 / 35
Connection Type:	PPPoA
Service Name:	pppoa_0_35_1
Service Category:	UBR
IP Address:	Automatically Assigned
Service State:	Enabled
NAT:	Enabled
Firewall:	Enabled
IGMP Multicast:	Disabled
Quality Of Service:	Disabled

Click "Save/Reboot" to save these settings and reboot router. Click "Back" to make any modifications.
NOTE: The configuration process takes about 1 minute to complete and your DSL Router will reboot.

 **Back** **Save/Reboot**

Wireless

Wireless -- Basic

The below **Wireless - Basic** screen lets you enable or disable wireless. The default setting for wireless is enabled. You can also hide the access point so others cannot see your ID on the network. Click on **Apply** to save your configurations before clicking on **Security** to continue to the Security configurations.

Home **Advanced** **Tools** **Status**

Wireless -- Basic

This page allows you to configure basic features of the wireless LAN interface. You can enable or disable the wireless LAN interface, hide the network from active scans, set the wireless network name (also known as SSID) and restrict the channel set based on country requirements. Click "Apply" to configure the basic wireless options.

Enable Wireless

Hide Access Point

SSID:

BSSID: 02:E0:18:00:00:01

Country:

Enable Wireless Guest Network

Guest SSID:

 **Apply** **Security**

Wireless - Security

The next screen is the **Wireless - Security** screen which allows you to select the network authentication method and to enable or disable WEP encryption. Note that depending on the network authentication that is selected, the screen will change accordingly so additional fields can be configured for the specific authentication method.

Network authentication methods include the following—

- **Open**—anyone can access the network. The default is a disabled WEP encryption setting.
- **Shared**—WEP encryption is enabled and encryption key strength of 64-bit or 128-bit needs to be selected. Click on **Set Encryption Keys** to manually set the network encryption keys. Up to 4 different keys can be set and you can come back to select which one to use at anytime.
- **802.1X**—requires mutual authentication between a client station and the router by including a RADIUS-based authentication server. Information about the RADIUS server such as its IP address, port and key must be entered. WEP encryption is also enabled and the encryption strength must also be selected.
- **WPA (Wi-Fi Protected Access)**— usually used for the larger Enterprise environment, it uses a RADIUS server and TKIP (Temporal Key Integrity Protocol) encryption (instead of WEP encryption which is disabled). TKIP uses 128-bit dynamic session keys (per user, per session, and per packet keys).
- **WPA-PSK (Wi-Fi Protected Access - Pre-Shared Key)**—WPA for home and SOHO environments also using the same strong TKIP encryption, per-packet key construction, and key management that WPA provides in the enterprise environment. The main difference is that the password is entered manually. A group re-key interval time is also required.
- **WPA2 (Wi-Fi Protected Access 2)**—second generation of WPA which uses AES (Advanced Encryption Standard) instead of TKIP as its encryption method. Network re-auth interval is the time in which another key needs to be dynamically issued.
- **WPA2-PSK (Wi-Fi Protected Access 2 - Pre-Shared Key)**—suitable for home and SOHO environments, it also uses AES encryption and requires you to enter a password and an re-key interval time.
- **Mixed WPA2 / WPA**—during transitional times for upgrades in the enterprise environment, this mixed authentication method allows “upgraded” and users not yet “upgraded” to access the network via the router. RADIUS server information must be entered for WPA and a as well as a group re-key interval time. Both TKIP and AES are used.
- **Mixed WPA2 / WPA-PSK**—useful during transitional times for upgrades in the home or SOHO environment, a pre-shared key must be entered along with the group re-key interval time. Both TKIP and AES are also used.

Home **Advanced** **Tools** **Status**

Wireless -- Security

This page allows you to configure security features of the wireless LAN interface. You can set the network authentication method, selecting data encryption, specify whether a network key is required to authenticate to this wireless network and specify the encryption strength. Click "Apply" to configure the wireless security options.

Select SSID:

Network Authentication:

WEP Encryption:

 
Back **Apply**

WAN

Configure the WAN settings as provided by your ISP.

Home **Advanced** **Tools** **Status**

WAN Setup

Choose Add, Edit, or Remove to configure WAN interfaces. Choose Finish to apply the changes and reboot the system.

VPI/VCI	Category	Service	Interface	Protocol	State	Remove	Edit	Action
0/35	UBR	ppp0a_0_35_1	ppp_0_35_1	PPPoA	Enabled	<input type="checkbox"/>		<input type="button" value="Up"/>

Click on the **Add** button if you want to add a new connection for the WAN interface and to proceed to the ATM PVC Configuration screen as seen below. The ATM PVC Configuration screen allows you to configure an ATM PVC identifier (VPI and VCI) and select a service category.

Find out the following values from your ISP before you change them.

- **VPI:** Virtual Path Identifier. The valid range is 0 to 255.
- **VCI:** Virtual Channel Identifier. The valid range is 32 to 65535.
- **Service Category:** Five classes of traffic are listed—
 - **UBR Without PCR** (*Unspecified Bit Rate without Peak Cell Rate*)—UBR service is suitable for applications that can tolerate variable delays and some cell losses. Applications suitable for UBR service include text/data/image transfer, messaging, distribution, and retrieval and also for remote terminal applications such as telecommuting.
 - **UBR With PCR** (*Unspecified Bit Rate with Peak Cell Rate*)--
 - **CBR** (*Constant Bit Rate*)—used by applications that require a fixed data rate that is continuously available during the connection time. It is commonly used for uncompressed audio and video information such as videoconferencing, interactive audio (telephony), audio / video distribution (e.g. television, distance learning, and pay-per-view), and audio / video retrieval (e.g. video-on-demand and audio library).
 - **Non Realtime VBR** (*Non-Real-time Variable Bit Rate*)—can be used for data transfers that have critical response-time requirements such as airline reservations, banking transactions, and process monitoring.
 - **Realtime VBR** (*Real-time Variable Bit Rate*)—used by time-sensitive applications such as real-time video. Rt-VBR service allows the network more flexibility than CBR.
- **Quality of Service:** Can be enabled only for *UBR without PCR*, *UBR with PCR*, and *Non Realtime VBR*.

Home
Advanced
Tools

WAN Setup

ATM PVC Configuration

This screen allows you to configure an ATM PVC identifier (VPI and VCI) and select a service category. Choose an existing interface by selecting the checkbox to enable it.

VPI: [0-255]

VCI: [32-65535]

Service Category:

Enable Quality Of Service

Enabling packet level QoS for a PVC improves performance for selected classes of applications. QoS cannot be set for CBR and Realtime VBR. QoS consumes system resources; therefore the number of PVCs will be reduced. Use **Advanced Setup/Quality of Service** to assign priorities for the applications.

Enable Quality Of Service

Next

The following screen shows the below types of network protocols and encapsulation modes—

- PPP over ATM (PPPoA)
- PPP over Ethernet (PPPoE)
- MAC Encapsulation Routing (MER)
- IP over ATM (IpoA)
- Bridging

If you will be using VLAN tagging, then click on the **Enable 802.1q** checkbox and then enter the VLAN ID number. *Note that the 802.1q function is only available if you select PPPoE, MER, or Bridging.* When finished with your selections, click on **Next** to continue.

The screenshot shows a web interface for WAN configuration. At the top, there are four tabs: 'Home' (highlighted in yellow), 'Advanced', 'Tools', and 'Status'. Below the tabs, the page title is 'WAN'. Underneath, there is a section titled 'Connection Type' with a grey background. A note reads: 'Select the type of network protocol and encapsulation mode over the ATM PVC that your ISP has instructed you to use. Note that 802.1q VLAN tagging is only available for PPPoE, MER and Bridging.' There are five radio button options: 'PPP over ATM (PPPoA)', 'PPP over Ethernet (PPPoE)' (which is selected), 'MAC Encapsulation Routing (MER)', 'IP over ATM (IPoA)', and 'Bridging'. Below this is a section titled 'Encapsulation Mode' with a dropdown menu currently showing 'LLC/SNAP-BRIDGING'. At the bottom of the page, there are two circular navigation buttons: a purple 'Back' button with a left arrow and a blue 'Next' button with a right arrow.

The following screen allows you to enter PPP username and password as well as make any selections regarding your connection.

- **Dial on demand:** Allows you to manually connect to the Internet so you are not permanently connected. Idle timeout timer is included.
- **PPP IP extension:** Used by some ISP's. Check with your ISP to see if it is required.
- **Keep alive:** Keeps you connected to your ISP even when no activity is present for a certain period of time.
- **Use static IP address:** Select if you want to use a non-DHCP issued IP address to connect to the Internet. If selected, you will be asked to enter the static IP address.

Setup - Summary

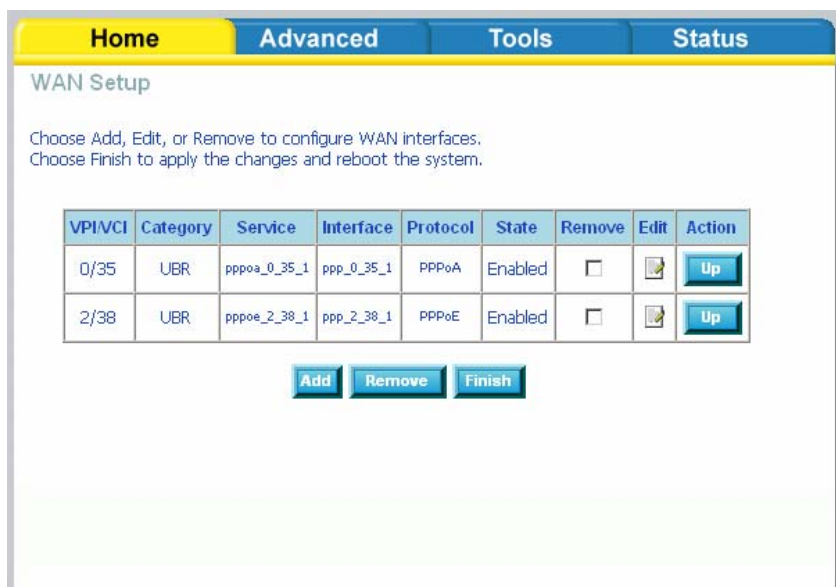

Make sure that the settings below match the settings provided by your ISP.

VPI / VCI:	2 / 38
Connection Type:	PPPoE
Service Name:	pppoe_2_38_1
Service Category:	UBR
IP Address:	Automatically Assigned
Service State:	Enabled
NAT:	Enabled
Firewall:	Enabled
IGMP Multicast:	Disabled
Quality Of Service:	Disabled

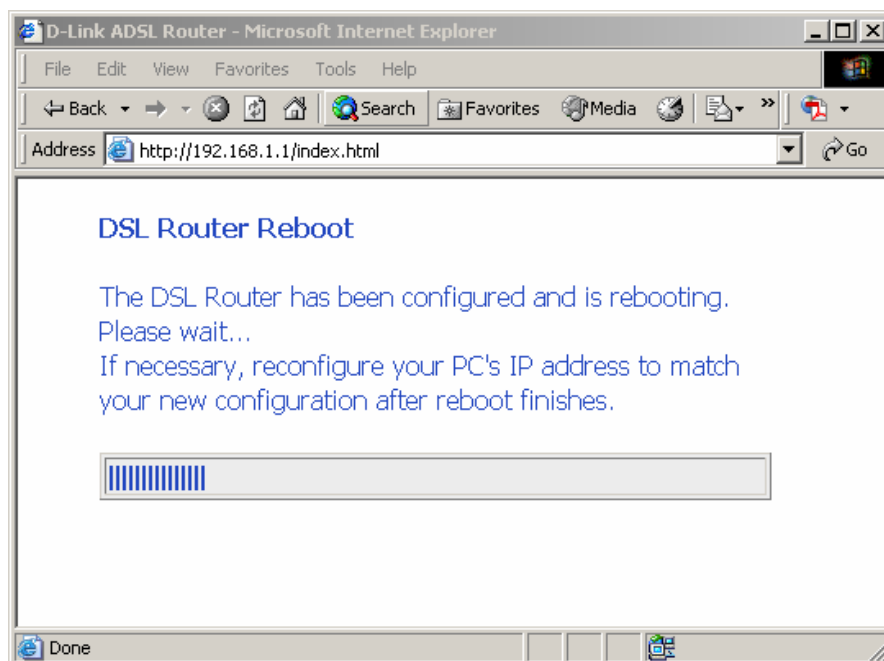

Click "Apply" to save these settings. Click "Back" to make any modifications.
NOTE: You need to reboot to activate this WAN interface and further configure services over this interface.

After you apply the configurations, it will return to the WAN Setup screen showing the new configurations. Select the **Finish** button to save the changes and reboot the router.

Below is the DSL Router Reboot screen that will appear during the rebooting process.

When completed, the below pop-up window will appear confirmation that the modem has been rebooted.

LAN

You can configure the DSL Router IP address and Subnet Mask for the LAN interface.

An available option if you will be multicasting is IGMP snooping, for which you can also select standard or blocking mode.

If you want the DHCP server to automatically assign IP addresses, enable DHCP server and enter the range of IP addresses that DHCP server can assign. Disable DHCP server if you would like to manually assign IP addresses.

Home **Advanced** **Tools** **Status**

Local Area Network (LAN) Setup

Configure the DSL Router IP Address and Subnet Mask for LAN interface. Save button only saves the LAN configuration data. Save/Reboot button saves the LAN configuration data and reboots the router to make the new configuration effective.

IP Address:

Subnet Mask:

Enable IGMP Snooping

Standard Mode

Blocking Mode

Disable DHCP Server

Enable DHCP Server

Start IP Address:

End IP Address:

Leased Time (hour):

Enable DHCP Server Relay

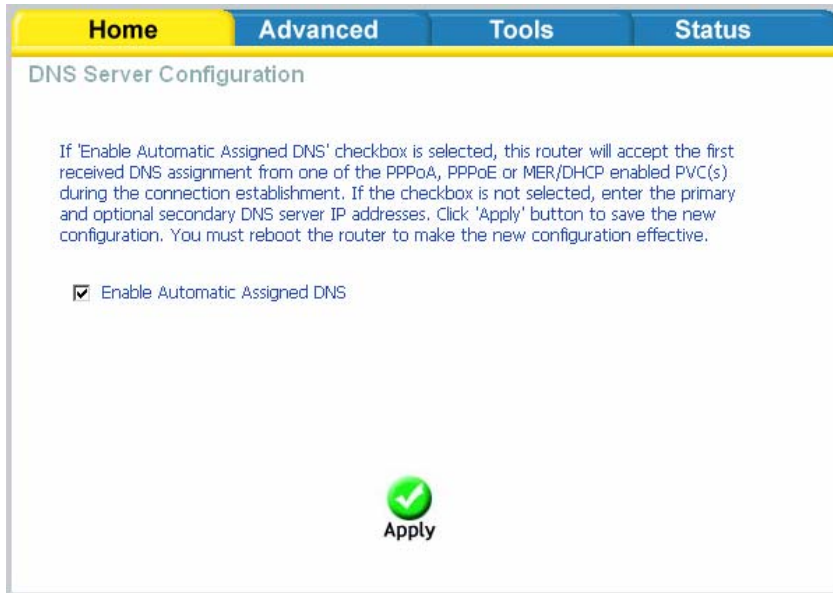

DHCP Server IP Address:

Configure the second IP Address and Subnet Mask for LAN interface

The **Save** button only saves the LAN configuration data, but does not apply the configurations. Select the **Save/Reboot** button to save the LAN configuration data and reboot the router and apply the new configurations.

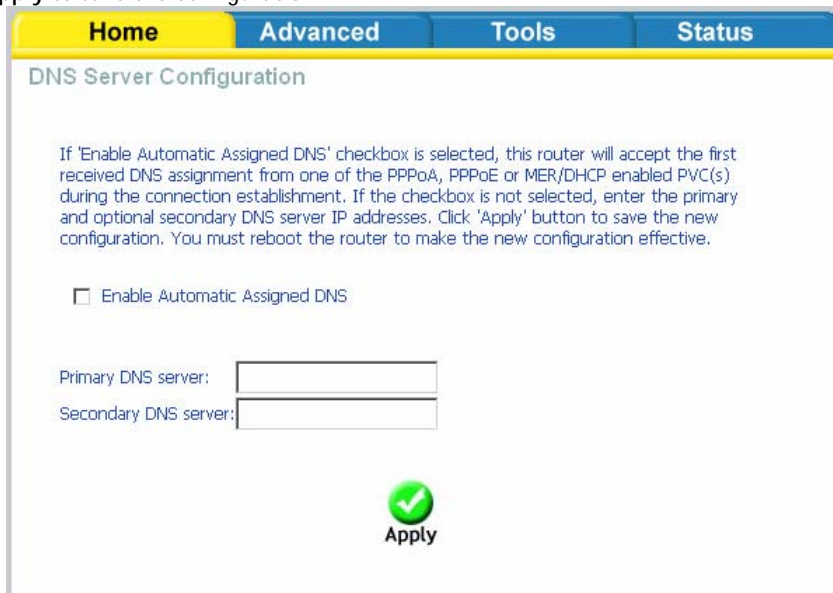

DNS Server Configuration

Use the DNS Server screen to request automatic assignment of a DNS or to specify a primary and secondary DNS.

The screenshot shows the 'DNS Server Configuration' page with a navigation bar at the top containing 'Home', 'Advanced', 'Tools', and 'Status'. Below the navigation bar, the page title is 'DNS Server Configuration'. A paragraph of text explains that if the 'Enable Automatic Assigned DNS' checkbox is selected, the router will accept the first received DNS assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC(s) during the connection establishment. If the checkbox is not selected, the user must enter the primary and optional secondary DNS server IP addresses. Below this text, the checkbox 'Enable Automatic Assigned DNS' is checked. At the bottom center, there is a green checkmark icon with the word 'Apply' underneath it.

If you uncheck the *Enable Automatic Assigned DNS* checkbox, two additional fields—primary and secondary DNS server—will appear. Enter the information and click on **Apply** to save the configuration.

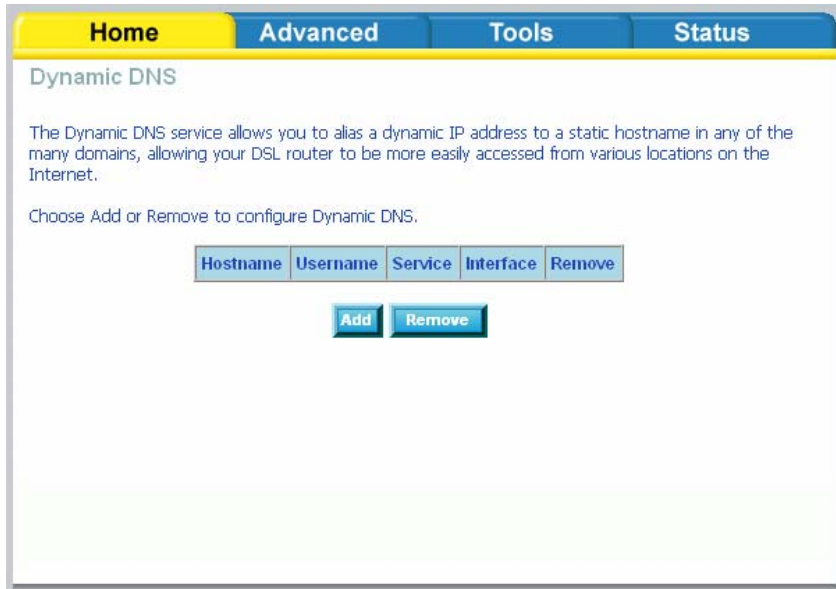

The screenshot shows the 'DNS Server Configuration' page with the same navigation bar. The checkbox 'Enable Automatic Assigned DNS' is now unchecked. Below the checkbox, there are two input fields: 'Primary DNS server:' and 'Secondary DNS server:'. At the bottom center, there is a green checkmark icon with the word 'Apply' underneath it.

Dynamic DNS

Dynamic DNS is a service for allowing an Internet domain name to be assigned to a varying IP address. This makes it possible for other sites on the Internet to establish connections to you without needing to track the IP address themselves. Click on **Add** to set up a dynamic DNS configuration.

Note that the **Add** and **Remove** buttons will only show up if you have established a WAN connection(s) (not including bridge connection).

The screenshot shows a web interface with a navigation bar at the top containing four tabs: **Home** (highlighted in yellow), **Advanced**, **Tools**, and **Status**. Below the navigation bar, the page title is **Dynamic DNS**. The main content area contains the following text: "The Dynamic DNS service allows you to alias a dynamic IP address to a static hostname in any of the many domains, allowing your DSL router to be more easily accessed from various locations on the Internet." Below this text, it says "Choose Add or Remove to configure Dynamic DNS." There are two buttons, **Add** and **Remove**, positioned below the text. Above these buttons is a table with five columns: **Hostname**, **Username**, **Service**, **Interface**, and **Remove**. The table is currently empty.

This screen allows you to add a dynamic DNS address from DynDNS.org or TZO. First select the D-DNS provider—*DynDNS.org* or *TZO*—from which you have obtained a dynamic DNS address. Enter the hostname and the interface that you are using. Also enter the username and password assigned by the DNS service. Click on **Apply** to save these configurations.

Home **Advanced** **Tools** **Status**

Add dynamic DDNS

This page allows you to add a Dynamic DNS address from DynDNS.org or TZO.

D-DNS provider:

Hostname:

Interface:

DynDNS Settings

Username:

Password:

 **Apply**

Logout

To log out of the router's user interface at any time during the setup, click on the **Logout** button. A confirmation screen will appear confirming that you really want to log out.

Home **Advanced** **Tools** **Status**

Logout

Logging out will close the browser.

Advanced Setup

This section of the setup is an advanced version of the quick setup. If you want to make specific configurations to your router such as creating a virtual server, DMZ, RIP, Quality of Service (QoS), etc., consider going through this advanced setup for a more comprehensive configuration.

ADSL

The ADSL settings page contains a modulation and capability section to be specified by your ISP. Consult your ISP to select the correct settings for each. Then click on **Apply** if you are finished or click on **Advanced Settings** if you want to configure more advanced settings.

D-Link
Building Networks for People

DSL-2640U

Home **Advanced** Tools Status

ADSL Settings

Select the modulation below.

- G.Dmt Enabled
- G.lite Enabled
- T1.413 Enabled
- ADSL2 Enabled
- AnnexL Enabled
- ADSL2+ Enabled
- AnnexM Enabled

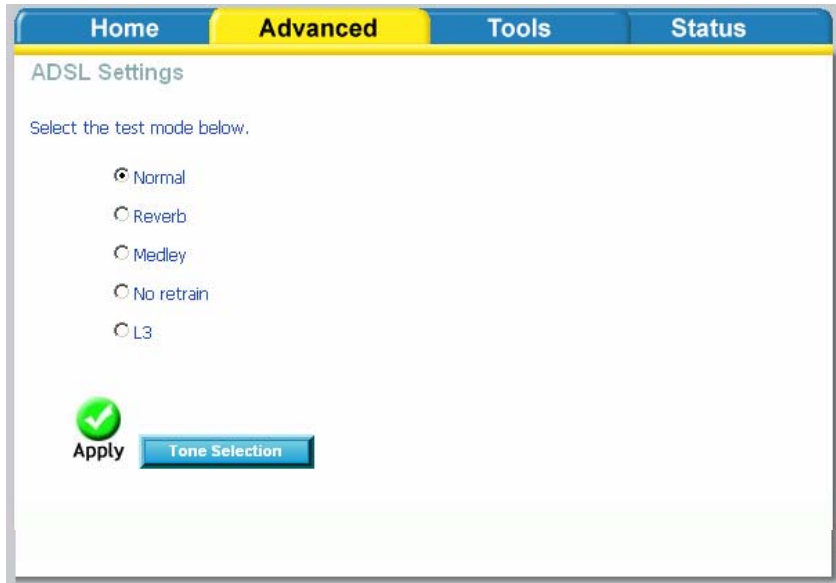

Capability

- Bitswap Enable
- SRA Enable

Apply **Advanced Settings**

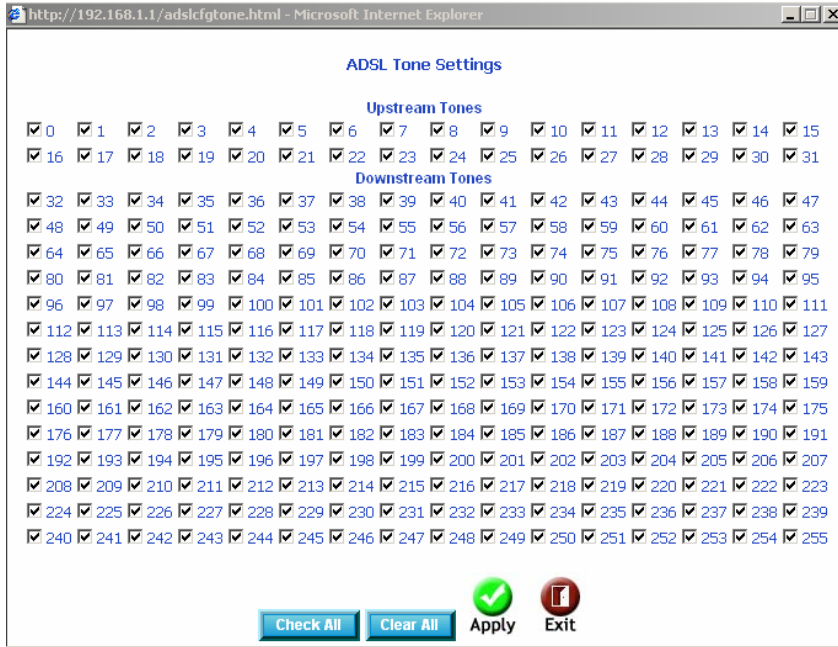

ADSL Settings

The test mode can be selected from the DSL Advanced Settings page. Test modes include—normal, reverb, medley, no retrain, and L3. After you make your selections of the test mode, click on **Apply** to save these settings first before you go to *Tone Selection*.

ADSL Tone Settings

The frequency band of ADSL is split up into 256 separate tones, each spaced 4.3125 kHz apart. With each tone carrying separate data, the technique operates as if 256 separate routers were running in parallel. The tone range is from 0 to 31 for upstream and from 32 to 255 for downstream. Do not change these settings unless directed by your ISP.

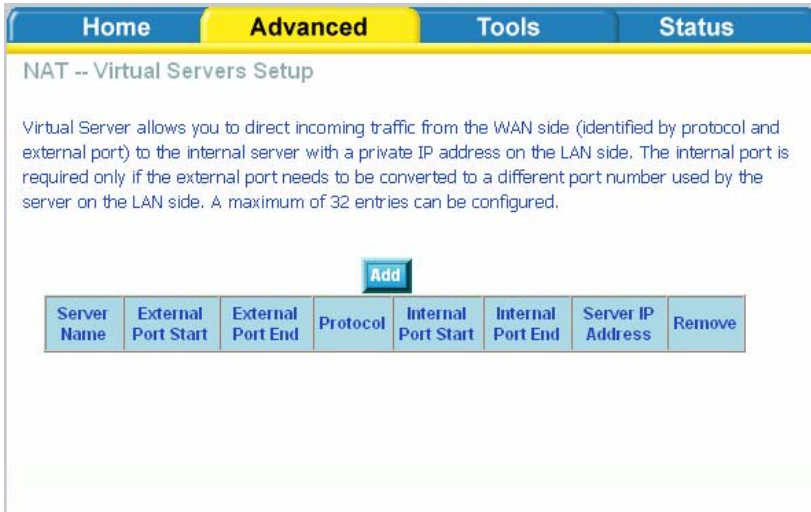

Virtual Server

If you enable NAT (Network Address Translation), you can configure the Virtual Server, Port Triggering, and DMZ Host.

NAT—Virtual Servers Setup

A virtual server allows you to direct incoming traffic from the WAN side to a specific IP address on the LAN side. The following figure shows the screen that allows you to configure your virtual server(s). Click on the **Add** button to configure a virtual server.

Select the virtual server from the drop-down list and complete the server IP address, then click on **Apply** once.

NAT -- Virtual Servers

Select the service name, and enter the server IP address and click "Apply" to forward IP packets for this service to the specified server. **NOTE: The "Internal Port End" cannot be changed. It is the same as "External Port End" normally and will be the same as the "Internal Port Start" or "External Port End" if either one is modified.**

The following screen appears after you save your selection. To add additional virtual servers, click on the **Add** button. If you need to remove any of the server names, select the check box and click on the **Remove** button.

Home **Advanced** **Tools** **Status**

NAT -- Virtual Servers Setup

Virtual Server allows you to direct incoming traffic from the WAN side (identified by protocol and external port) to the internal server with a private IP address on the LAN side. The internal port is required only if the external port needs to be converted to a different port number used by the server on the LAN side. A maximum of 32 entries can be configured.

DMZ

You can define the IP address of the DMZ Host on this screen. Enter the IP address and click on **Apply**.

Home **Advanced** **Tools** **Status**

DMZ Host

The DSL router will forward IP packets from the WAN that do not belong to any of the applications configured in the Virtual Servers table to the DMZ host computer.

Enter the computer's IP address and click "Apply" to activate the DMZ host.

Clear the IP address field and click "Apply" to deactivate the DMZ host.

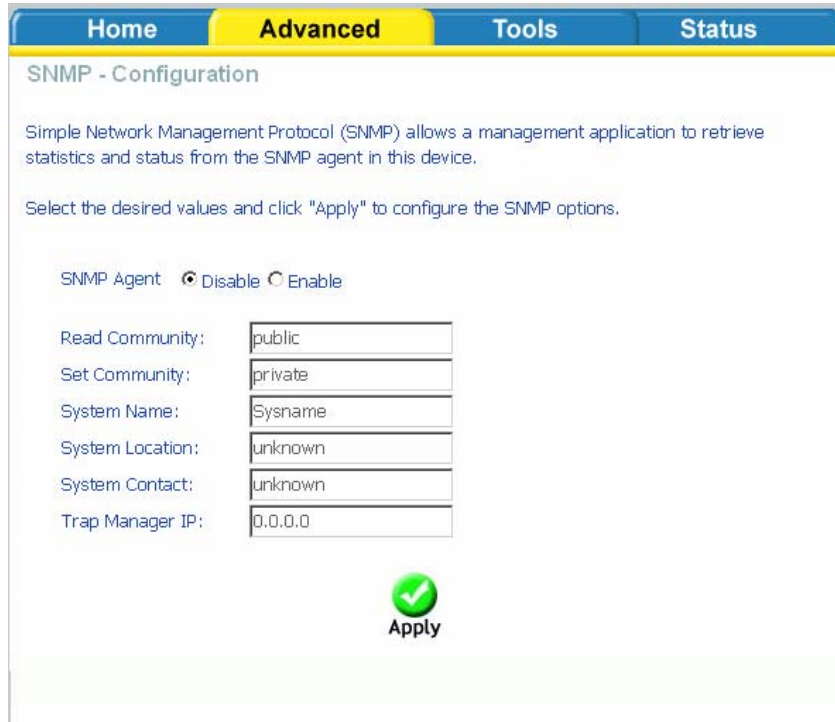

DMZ Host IP Address:

 **Apply**

SNMP

SNMP—Configuration

SNMP is Simple Network Management Protocol that provides a means to monitor status and performance as well as set configuration parameters. It enables a management station to configure, monitor and receive trap messages from network devices.

The image shows a web interface for configuring SNMP. At the top, there are four tabs: Home, Advanced (selected), Tools, and Status. Below the tabs, the page title is "SNMP - Configuration". A descriptive paragraph explains that SNMP allows a management application to retrieve statistics and status from the SNMP agent in this device. Below this, a instruction says "Select the desired values and click 'Apply' to configure the SNMP options." The configuration options are as follows:

SNMP Agent	<input checked="" type="radio"/> Disable <input type="radio"/> Enable
Read Community:	<input type="text" value="public"/>
Set Community:	<input type="text" value="private"/>
System Name:	<input type="text" value="Sysname"/>
System Location:	<input type="text" value="unknown"/>
System Contact:	<input type="text" value="unknown"/>
Trap Manager IP:	<input type="text" value="0.0.0.0"/>

At the bottom center of the form is a green circular button with a white checkmark and the text "Apply" below it.

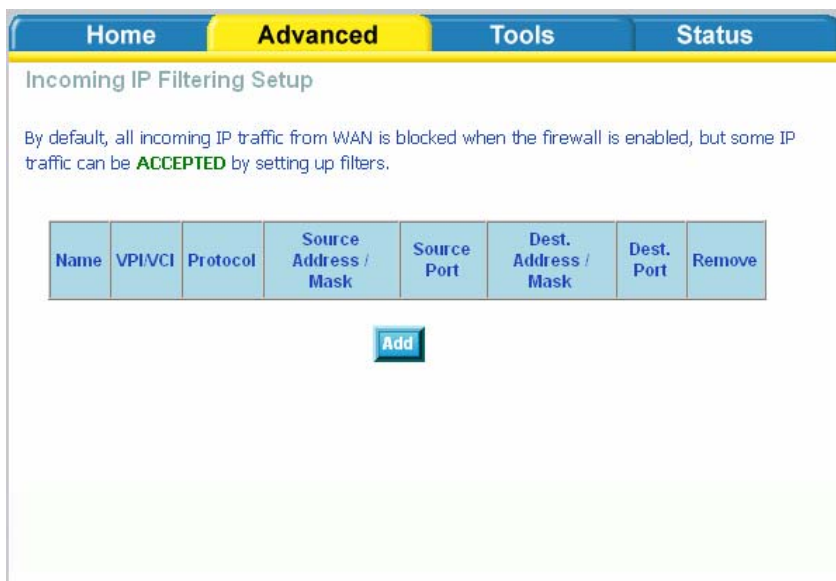

IP Filter

IP filters can be configured to manage your incoming and outgoing traffic. Click on the Inbound and Outbound buttons to advance to the next section for further configuration.

Incoming IP Filtering Setup

Incoming IP filter allows specified the WAN traffic to pass through the firewall. Click on the **Add** button to add incoming filter settings.

Enter a filter name, information about the source address (from the WAN side), and information about the destination address (to the LAN side). Select the protocol and WAN interface, then click on **Apply** to add the setting.

Home **Advanced** **Tools** **Status**

Add IP Filter -- Incoming

The screen allows you to create a filter rule to identify incoming IP traffic by specifying a new filter name and at least one condition below. All of the specified conditions in this filter rule must be satisfied for the rule to take effect. Click 'Apply' to save and activate the filter.

Filter Name:

Protocol:

Source IP address:

Source Subnet Mask:

Source Port (port or port:port):

Destination IP address:

Destination Subnet Mask:

Destination Port (port or port:port):

WAN Interfaces (Configured in Routing mode and with firewall enabled only)
Select at least one or multiple WAN interfaces displayed below to apply this rule.

- Select All
- pppoe_0_35_1/ppp_0_35_1
- pppoe_2_38_1/ppp_2_38_1

Apply

The following screen appears when you apply the IP filter. The screen lists the IP filters that were added from the previous screen. To change your settings, click on the **Add** or **Remove** buttons.

Home **Advanced** Tools Status

Incoming IP Filtering Setup

By default, all incoming IP traffic from WAN is blocked when the firewall is enabled, but some IP traffic can be **ACCEPTED** by setting up filters.

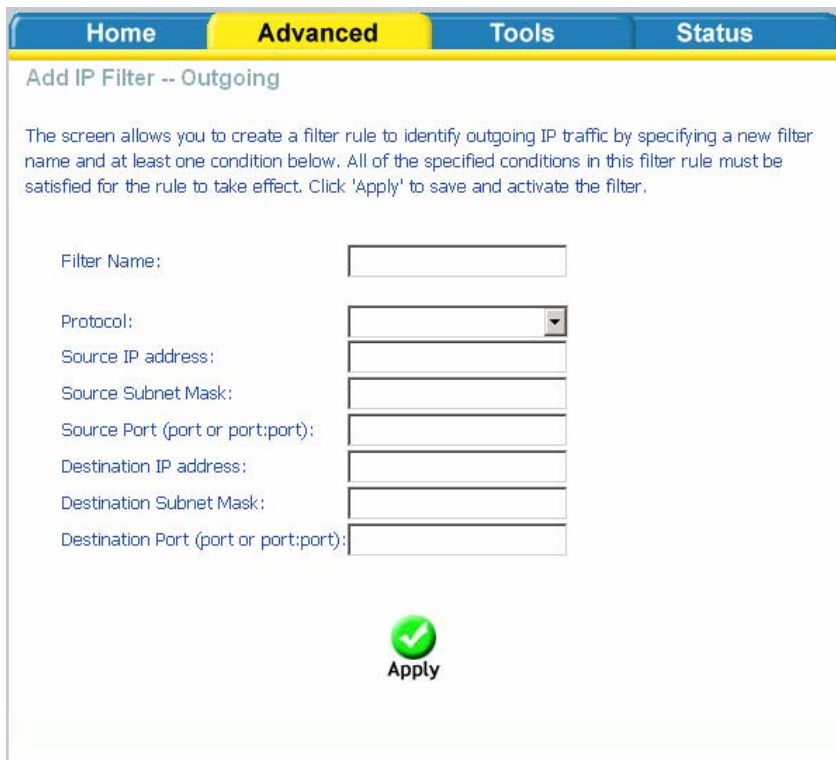

Name	VPI/VCI	Protocol	Source Address / Mask	Source Port	Dest. Address / Mask	Dest. Port	Remove
Test	ALL	TCP/UDP	192.168.2.5				<input type="checkbox"/>

Outgoing IP Filtering Setup

The outgoing filter will block the LAN traffic from entering the WAN side. Click on the **Add** button to create filters.

The below screen will appear when you click on **Add**. Input the filter name, source information (from the LAN side), and destination information (from the WAN side). Then click on **Apply** to save.

The following screen appears when you apply the IP filter. The screen lists the IP filters that were added from the previous screen. To change your settings, click on the **Add** or **Remove** buttons.

Home **Advanced** Tools Status

Outgoing IP Filtering Setup

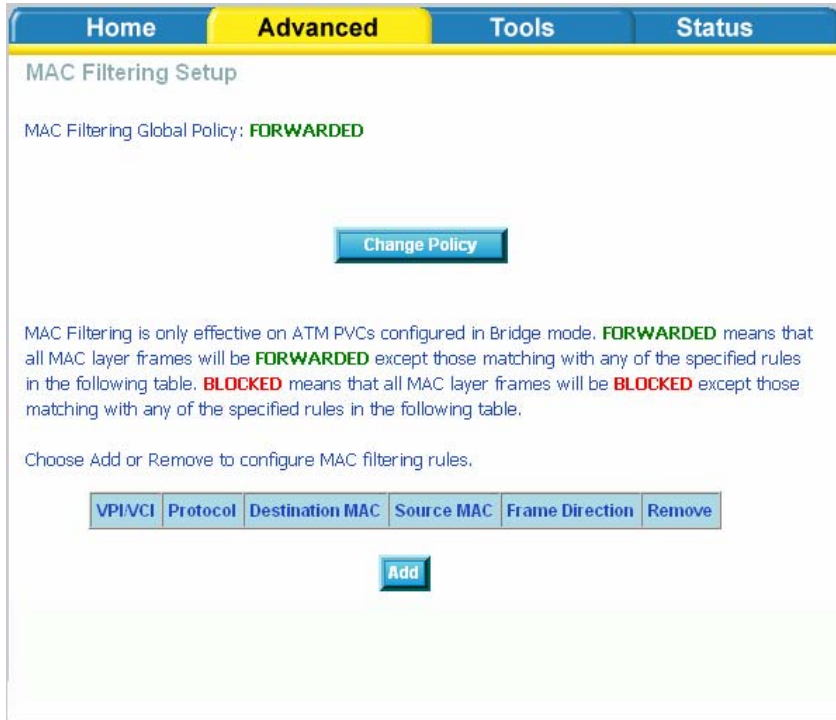

By default, all outgoing IP traffic from LAN is allowed, but some IP traffic can be **BLOCKED** by setting up filters.

Name	Protocol	Source Address / Mask	Source Port	Dest. Address / Mask	Dest. Port	Remove
Test	TCP	192.168.1.5		192.168.1.8		<input type="checkbox"/>

Bridge Filters

MAC Filtering Setup

MAC filtering can forward or block traffic by MAC address. You can change the policy or add settings to the MAC filtering table using the MAC Filtering Setup screen.

If you click on Change Policy, a confirmation dialog allows you to verify your change.

If you want to add a setting to the MAC filtering table, select protocol type, enter the destination and source MAC address, the necessary frame direction, and WAN interface (bridge mode only). Then click on **Apply** to save.

After you save the settings, a screen showing the settings will appear. On this screen you will be able to view and delete MAC filtering rules.

Parental Control

Time of Day Restrictions

In a home setting, parents can also restrict the day of the week certain computers can access the router. Click on **Add** to set up the restrictions.

After you click you on **Add**, you will see the below screen where you will be able to enter the MAC address of the PC that you wish to place on a time of day restriction. Click on **Apply** to save the settings and to continue.

Home	Advanced	Tools	Status
------	----------	-------	--------

Time of Day Restriction

This page adds a time of day restriction to a special LAN device connected to the router. The "Browser's MAC Address" automatically displays the MAC address of the LAN device where the browser is running. To restrict another LAN device, click the "Other MAC Address" button and enter the MAC address of the other LAN device. To find out the MAC address of a Windows-based PC, open a command prompt window and type "ipconfig /all".

User Name

Browser's MAC Address

Other MAC Address

Routing

Static route, default gateway, and RIP type routing configurations can be performed here.

Routing--Static Route

The Static Route page can be used to add a routing table (a maximum of 32 entries can be configured). To proceed, click on **Add**.

Enter the route information and then apply your configurations.

Home	Advanced	Tools	Status
<h3>Routing -- Static Route Add</h3> <p>Enter the destination network address, subnet mask, gateway AND/OR available WAN interface then click "Apply" to add the entry to the routing table.</p> <p>Destination Network Address: <input type="text"/></p> <p>Subnet Mask: <input type="text"/></p> <p><input type="radio"/> Use Gateway IP Address <input type="text"/></p> <p><input type="radio"/> Use Interface <input type="text"/></p> <p style="text-align: center;"> Apply</p>			

Routing—Default Gateway

The router has the ability to accept the first received default gateway assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC's. This function is enabled by default as seen below.

Home	Advanced	Tools	Status
<h3>Default Gateway</h3> <p>If Enable Automatic Assigned Default Gateway checkbox is selected, this router will accept the first received default gateway assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC (s). If the checkbox is not selected, enter the static default gateway AND/OR a WAN interface. Click 'Apply' button to save it.</p> <p>NOTE: If changing the Automatic Assigned Default Gateway from unselected to selected, You must reboot the router to get the automatic assigned default gateway.</p> <p><input checked="" type="checkbox"/> Enable Automatic Assigned Default Gateway</p> <p style="text-align: center;"> Apply</p>			

If you uncheck the **Enable Automatic Assigned Default Gateway** option, the below screen will be shown. Enter the default gateway IP address or select the established gateway to be used.

Home **Advanced** **Tools** **Status**

Default Gateway

If Enable Automatic Assigned Default Gateway checkbox is selected, this router will accept the first received default gateway assignment from one of the PPPoA, PPPoE or MER/DHCP enabled PVC(s). If the checkbox is not selected, enter the static default gateway AND/OR a WAN interface. Click 'Apply' button to save it.

NOTE: If changing the Automatic Assigned Default Gateway from unselected to selected, You must reboot the router to get the automatic assigned default gateway.

Enable Automatic Assigned Default Gateway

Use Default Gateway IP Address

Add

This screen allows you to add a network traffic class rule.

Home **Advanced** **Tools** **Status**

Add Network Traffic Class Rule

The screen creates a traffic class rule to classify the upstream traffic, assign queuing priority and optionally overwrite the IP header TOS byte. A rule consists of a class name and at least one condition below. All of the specified conditions in this classification rule must be satisfied for the rule to take effect. Click 'Apply' to save and activate the rule.

Traffic Class Name:

Enable Differentiated Service Configuration

Assign ATM Priority and/or IP Precedence and/or Type Of Service for the class
If non-blank value is selected for 'Mark IP Precedence' and/or 'Mark IP Type Of Service', the corresponding TOS byte in the IP header of the upstream packet is overwritten by the selected value.

Note: If Differentiated Service Configuration checkbox is selected, you will only need to assign ATM priority. IP Precedence will not be used for classification. IP TOS byte will be used for DSCP mark.

Assign ATM Transmit Priority:

Mark IP Precedence:

Mark IP Type Of Service:

Mark 802.1p if 802.1q is enabled on WAN:

Specify Traffic Classification Rules
Enter the following conditions either for IP level, SET-1, or for IEEE 802.1p, SET-2.

SET-1

Destination IP Address:

Destination Subnet Mask:

UDP/TCP Destination Port (port or port:port):

SET-2

802.1p Priority:

 **Apply**

Port Mapping

Port mapping is a feature that allows you to open ports to allow certain Internet applications on the WAN side to pass through the firewall and enter your LAN. To use this feature, mapping groups should be created.

Click on the **Add** button as displayed below. If you need to remove an entry, then click on the **Remove** button.

Port Mapping -- A maximum 16 entries can be configured

Port Mapping supports multiple port to PVC and bridging groups. Each group will perform as an independent network. To support this feature, you must create mapping groups with appropriate LAN and WAN interfaces using the Add button. The Remove button will remove the grouping and add the ungrouped interfaces to the Default group

Enable virtual ports on

Group Name	Interfaces	Remove	Edit
Default	LAN(1-4), Wireless, Wireless_Guest		

After clicking the **Add** button, the below configuration screen appears, allowing you enter the groups and the interfaces they are associated with.

Port Mapping Configuration

To create a new mapping group:

1. Enter the Group name and select interfaces from the available interface list and add it to the grouped interface list using the arrow buttons to create the required mapping of the ports. The group name must be unique.
2. If you like to automatically add LAN clients to a PVC in the new group add the DHCP vendor ID string. By configuring a DHCP vendor ID string any DHCP client request with the specified vendor ID (DHCP option 60) will be denied an IP address from the local DHCP server.
Note that these clients may obtain public IP addresses

3. Click Apply button to make the changes effective immediately

Note that the selected interfaces will be removed from their existing groups and added to the new group.

IMPORTANT If a vendor ID is configured for a specific client device, please **REBOOT** the client device attached to the modem to allow it to obtain an appropriate IP address.

Group Name:

Grouped Interfaces

Available Interfaces

LAN(1-4)

Apply

Certificate

There are two types of certificates—local & trusted CA.

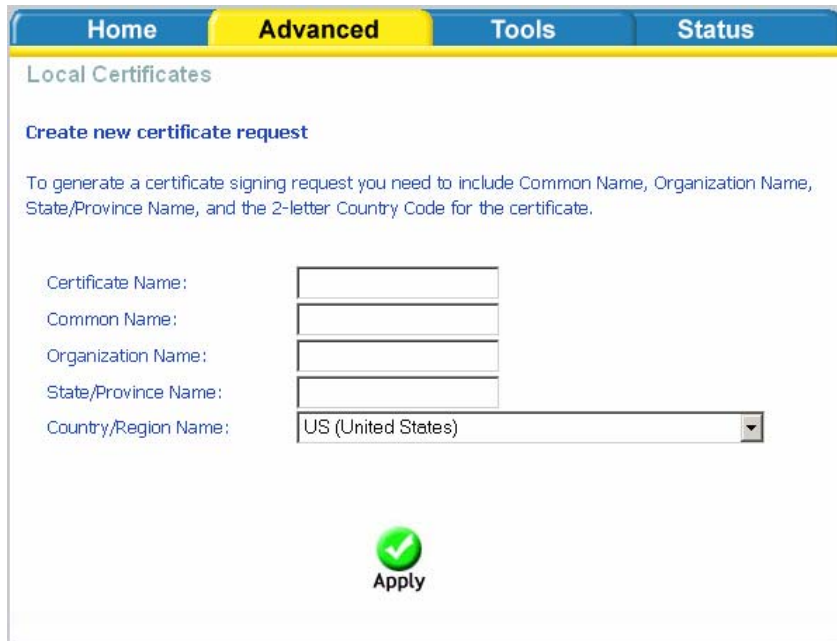

Local

A local certificate identifies your router over the network. To apply for a certificate, click on **Create Certificate Request** and if you have an existing certificate, click on **Import Certificate** to retrieve it.

If you need to create a certificate request, enter the following information—

- Certificate name
- Common name
- Organization name
- State/province name
- Country/region name.

The screenshot shows a web application interface with a navigation bar at the top containing four tabs: "Home", "Advanced", "Tools", and "Status". The "Advanced" tab is currently selected and highlighted in yellow. Below the navigation bar, the page title is "Local Certificates". Underneath, there is a section titled "Create new certificate request". A descriptive paragraph states: "To generate a certificate signing request you need to include Common Name, Organization Name, State/Province Name, and the 2-letter Country Code for the certificate." Below this text are five input fields arranged vertically. The first four are text boxes labeled "Certificate Name:", "Common Name:", "Organization Name:", and "State/Province Name:". The fifth is a dropdown menu labeled "Country/Region Name:" with "US (United States)" selected. At the bottom center of the form area is a green circular button with a white checkmark and the word "Apply" written below it.

If you already have a certificate, then you can simply import the certificate by pasting the certificate content and private key into the space provided. Click **Apply** to submit the request to import the certificate.

Home **Advanced** Tools Status

Local Certificates

Import certificate

Enter certificate name, paste certificate content and private key.

Certificate Name:

Certificate:

```
-----BEGIN CERTIFICATE-----  
<insert certificate here>  
-----END CERTIFICATE-----
```

Private Key:

```
-----BEGIN RSA PRIVATE KEY-----  
<insert private key here>  
-----END RSA PRIVATE KEY-----
```

 **Apply**

Trusted CA

The trusted certificate authority (CA) allows you to verify the certificates of your peers. Note that you can store up to 4 certificates. The below screen also allows you to view the CA's that you may have already added and can be removed. Click on **Import Certificate** to continue to the next screen.

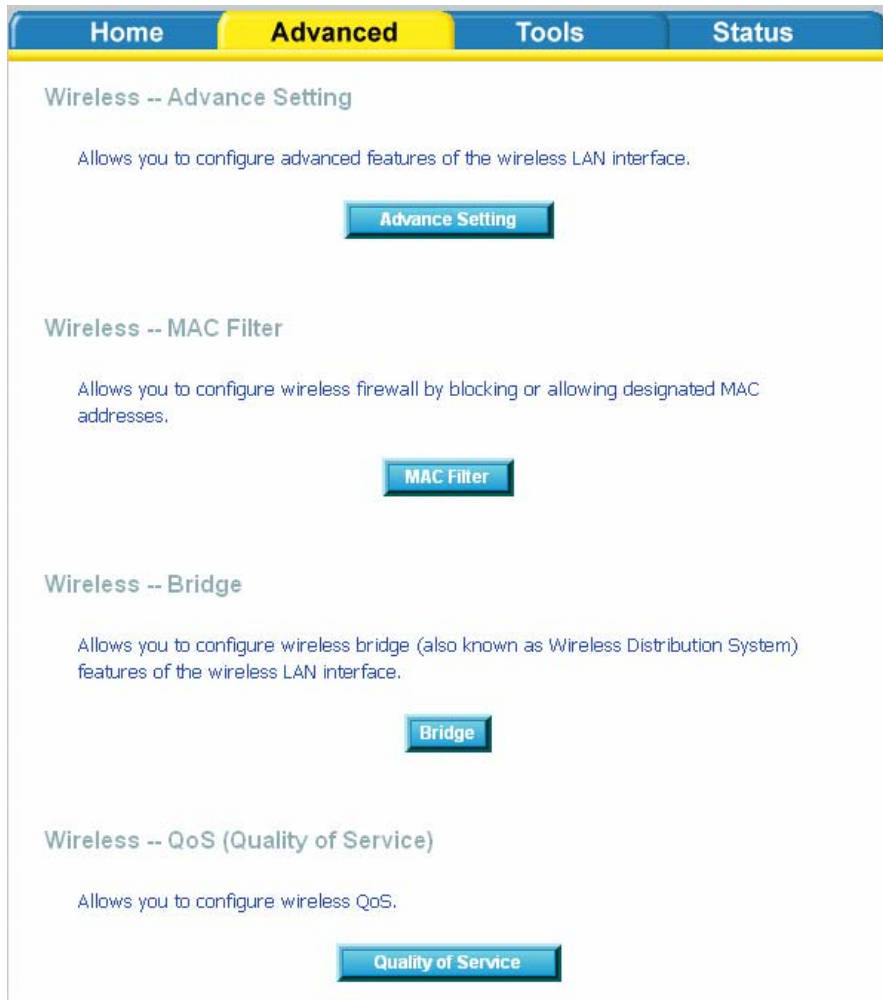

Paste the content of the certificate that you wish to add and click **Apply**.

Wireless

The Wireless section under Advanced contains three sections for further configurations. Sections include—

- Advanced Settings
- MAC Filter
- Bridge
- QoS (Quality of Service)

Wireless—Advance Setting

Advanced features of the wireless LAN interface can be configured in this section.

Settings can be configured for the following—

- **AP Isolation**—if you select enable, then each of your wireless clients will not be able to communicate with each other.
- **Band**—a default setting at 2.4GHz - 802.11g

- **Channel**—802.11b and 802.11g use channels to limit interference from other devices. If you are experiencing interference with another 2.4GHz device such as a baby monitor, security alarm, or cordless phone, then change the channel on your router.
- **54g™ Rate**—the wireless link rate at which information will be received and transmitted on your wireless network.
- **Multicast Rate**—the rate at which a message is sent to a specified group of recipients.
- **Basic Rate**—the set of data transfer rates that all the stations will be capable of using to receive frames from a wireless medium.
- **Fragmentation Threshold**—used to fragment packets which help improve performance in the presence of radio frequency (RF) interference.
- **RTS Threshold (Request to Send Threshold)**—determines the packet size of a transmission through the use of the router to help control traffic flow.
- **DTIM Interval**—sets the Wake-up interval for clients in power-saving mode.
- **Beacon Interval**—a packet of information that is sent from a connected device to all other devices where it announces its availability and readiness. A beacon interval is a period of time (sent with the beacon) before sending the beacon again. The beacon interval may be adjusted in milliseconds (ms).
- **Xpress Technology**—a technology that utilizes standards based on framebursting to achieve higher throughput. With Xpress Technology enabled, aggregate throughput (the sum of the individual throughput speeds of each client on the network) can improve by up to 25% in 802.11g only networks and up to 75% in mixed networks comprised of 802.11g and 802.11b device.
- **54g Mode**— 54g is a Broadcom Wi-Fi technology.
- **54g Protection**—the 802.11g standards provide a protection method so 802.11g and 802.11b devices can co-exist in the same network without “speaking” at the same time. Do not disable 54g Protection if there is a possibility that a 802.11b device may need to use your wireless network. In Auto Mode, the wireless device will use RTS/CTS (Request to Send / Clear to Send) to improve 802.11g performance in mixed 802.11g/802.11b networks. Turn protection off to maximize 802.11g throughput under most conditions.
- **Preamble Type**— this is the length of the CRC (Cyclic Redundancy Check) block for communication between the router and wireless clients. High network traffic areas should select Short preamble type.
- **Transmit Power**— this is the percentage of power that should be transmitted from your wireless router. Select from 20%, 40%, 60%, 80%, and 100%.

Wireless -- Advanced

This page allows you to configure advanced features of the wireless LAN interface. You can select a particular channel on which to operate, force the transmission rate to a particular speed, set the fragmentation threshold, set the RTS threshold, set the wakeup interval for clients in power-save mode, set the beacon interval for the access point, set XPress mode and set whether short or long preambles are used. Click "Apply" to configure the advanced wireless options.

Wireless—MAC Filter

The MAC Filter feature allows you to disable, allow or deny users access to the wireless router based on their MAC address. To add MAC addresses, click on **Add** to continue. Click on **Remove** if you want to take out a MAC address from the MAC filter list.

The MAC filter screen allows you to manage MAC address filters. Add the MAC addresses that you want to manage and then select the mode that you want to use to manage them. You can disable this feature or you can allow or deny access to the MAC addresses that you add to the list.

Wireless—Bridge

In this next screen, you can select which mode you want the router to be in, either access point or wireless bridge. If you enable bridge restrict, then enter the MAC addresses of the remote bridges. If you disable the bridge restrict function, then there are no MAC addresses to enter. Click on **Save / Apply** to save and continue.

Home **Advanced** **Tools** **Status**

Wireless -- Bridge

This page allows you to configure wireless bridge features of the wireless LAN interface. You can select Wireless Bridge (also known as Wireless Distribution System) to disables access point functionality. Selecting Access Point enables access point functionality. Wireless bridge functionality will still be available and wireless stations will be able to associate to the AP. Select Disabled in Bridge Restrict which disables wireless bridge restriction. Any wireless bridge will be granted access. Selecting Enabled or Enabled(Scan) enables wireless bridge restriction. Only those bridges selected in Remote Bridges will be granted access. Click "Refresh" to update the remote bridges. Wait for few seconds to update. Click "Save/Apply" to configure the wireless bridge options.

AP Mode:

Remote Bridges MAC Address:

<input type="text"/>	<input type="text"/>
<input type="text"/>	<input type="text"/>

Wireless—QoS

WMM (Wi-Fi Multimedia) technology is available on the wireless router, allowing you to give multimedia applications a higher quality of service and priority in a wireless network so applications such as videos will be of higher quality. Enabling WMM may delay the network traffic of other lower assigned quality applications.

WMM No Acknowledgement can be enabled if you enable WMM which refers to the acknowledgement policy used at the MAC level.

To create a QoS entry, click the **Add QoS Entry** button to proceed to add or remove traffic class rules for your network. Click on **Save/Apply WME Settings**.

WMM(Wi-Fi Multimedia) Settings

WMM(Wi-Fi Multimedia):

WMM No Acknowledgement:

Wireless Qos Classes
Choose Add or Remove to configure network traffic classes.

Class Name	Priority	TRAFFIC CLASSIFICATION RULES				
		Protocol	Source Addr.Mask	Source Port	Dest. Addr.Mask	Dest. Port

Tools

The tools section contains various administrator functions to maintain your router. Sections include the following—Admin, Time, Remote Log, System, Firmware, and Test.

- **Admin:** Allows you to change the password for the various user names available
- **Time:** Allows you to set the router's time
- **Remote Log:** Allows you to view logs of the router's activities
- **System:** Allows you to perform functions such as save / reboot, backup, update settings, and restore default settings
- **Firmware:** Allows you to upgrade your router with new available firmware versions
- **Test:** Allows you to view test information for your Internet connection

Access Control

You can enable or disable some services of your router by LAN or WAN. If no WAN connection is defined, only the LAN side can be configured.

Access Control—Admin

Three user names and passwords—**admin**, **support**, and **user**—can be used to control your router. The passwords for these user names can be changed on the following screen. Enter the user name followed by the old password and the new password that you wish to change to.

Home	Advanced	Tools	Status
<h3>Administrator Settings</h3> <p>Access to your DSL router is controlled through three user accounts: admin, support, and user.</p> <p>The user name "admin" has unrestricted access to change and view configuration of your DSL Router.</p> <p>The user name "support" is used to allow an ISP technician to access your DSL Router for maintenance and to run diagnostics.</p> <p>The user name "user" can access the DSL Router, view configuration settings and statistics, as well as, update the router's software.</p> <p>Use the fields below to enter up to 16 characters and click "Apply" to change or create passwords. Note: Password cannot contain a space.</p> <p>Username: <input type="text"/></p> <p>Old Password: <input type="text"/></p> <p>New Password: <input type="text"/></p> <p>Confirm Password: <input type="text"/></p> <p style="text-align: center;"> Apply</p>			

Access Control—Services

Services that can be enabled / disabled on the LAN / WAN are FTP, HTTP, ICMP, SNMP, Telnet, and TFTP.

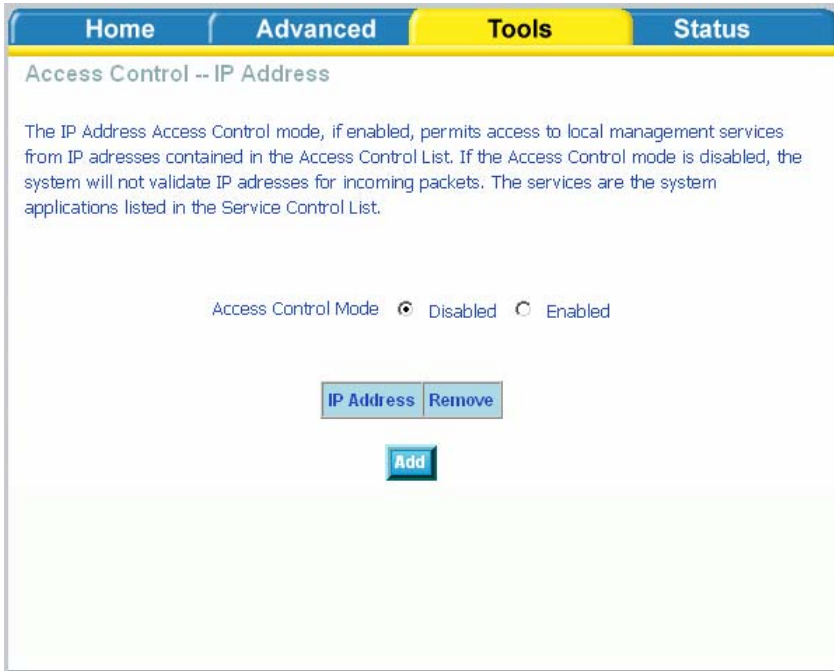

Service	LAN	WAN
FTP	<input type="checkbox"/> Enabled	<input type="checkbox"/> Enabled
HTTP	<input checked="" type="checkbox"/> Enabled	<input type="checkbox"/> Enabled
ICMP	<input checked="" type="checkbox"/> Enabled	<input type="checkbox"/> Enabled
SNMP	<input checked="" type="checkbox"/> Enabled	<input type="checkbox"/> Enabled
TELNET	<input checked="" type="checkbox"/> Enabled	<input type="checkbox"/> Enabled
TFTP	<input checked="" type="checkbox"/> Enabled	<input type="checkbox"/> Enabled

Apply

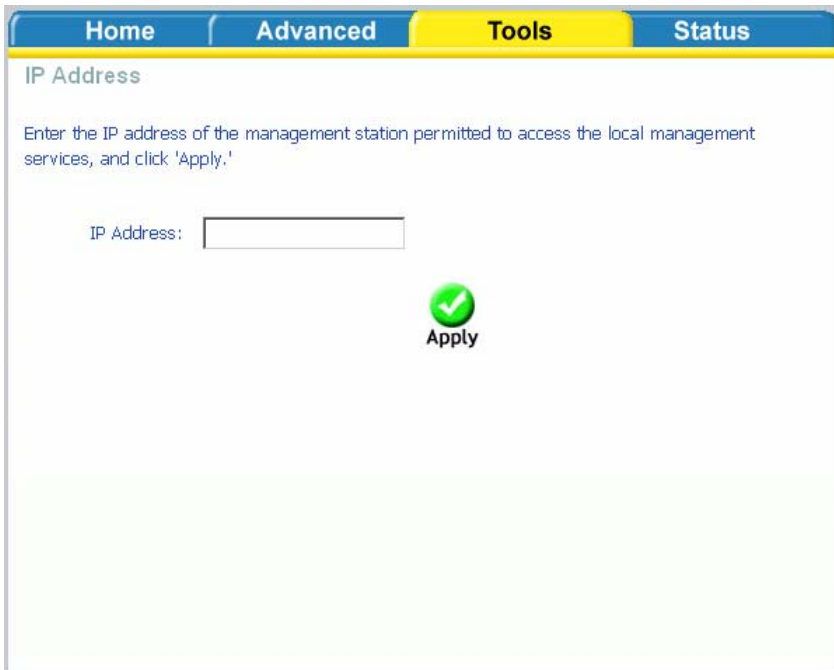

Access Control—IP Address

Web access to the router can be limited when Access Control Mode is enabled. The IP addresses of allowed hosts can be added using Access Control→IP Address.

Add the IP address to the IP address list by clicking on the **Add** button, then select **Enabled** to enable Access Control Mode.

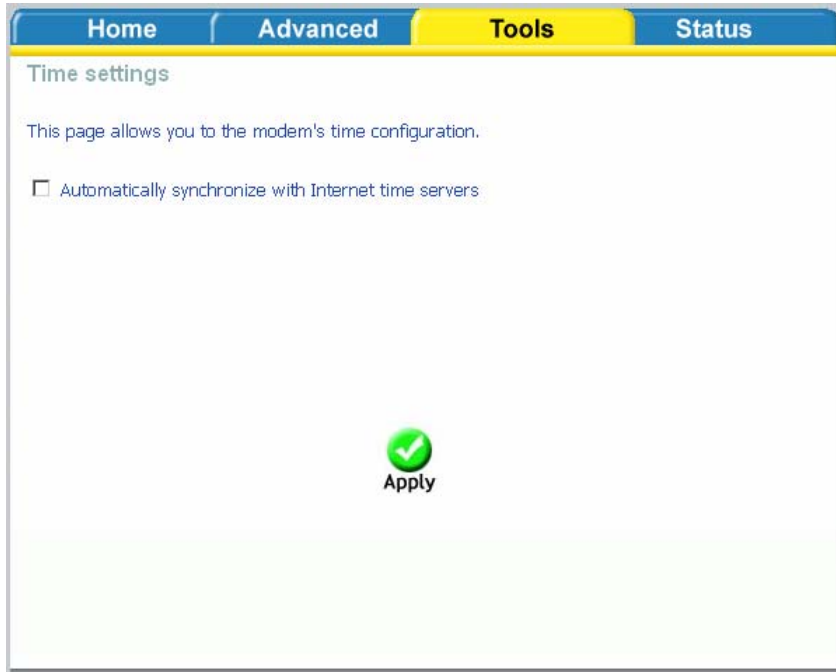

To assign the IP address of the management station that is permitted to access the local management services, enter the IP address in the box and click on the **Apply** button.

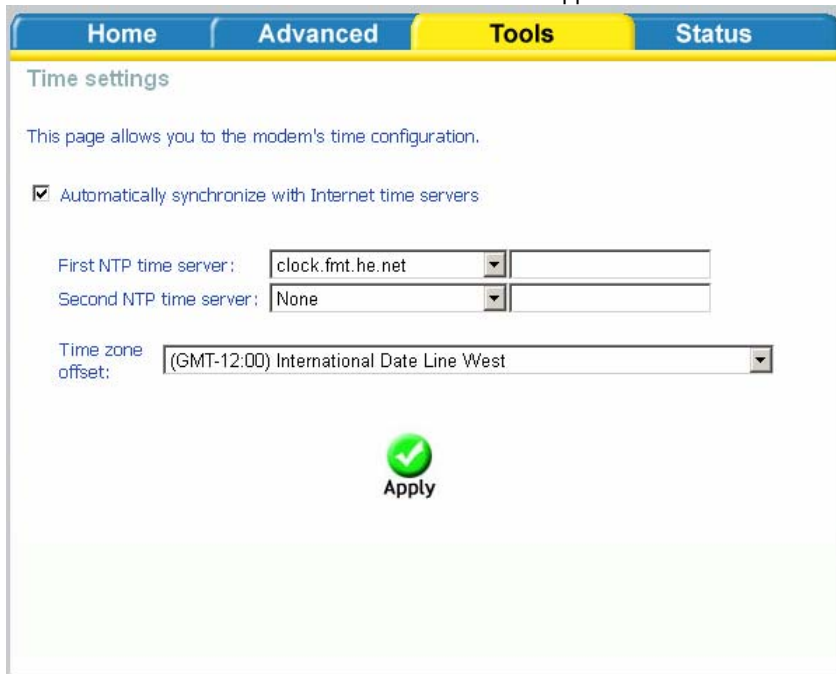

Time

The Time Settings page allows you to automatically synchronize your time with a time server on the Internet.

The screenshot shows a web interface with a navigation bar at the top containing 'Home', 'Advanced', 'Tools' (highlighted in yellow), and 'Status'. Below the navigation bar is the 'Time settings' section. It contains the text 'This page allows you to the modem's time configuration.' and a single checkbox labeled 'Automatically synchronize with Internet time servers' which is currently unchecked. At the bottom center of the page is a green circular icon with a white checkmark and the word 'Apply' below it.

If you choose to set the router's time, click on the "automatically synchronize with Internet time servers" checkbox and the below fields appear.

The screenshot shows the same web interface as the previous one, but with the 'Automatically synchronize with Internet time servers' checkbox checked. Below the checkbox, three additional fields are visible: 'First NTP time server:' with a dropdown menu showing 'clock.fmt.he.net', 'Second NTP time server:' with a dropdown menu showing 'None', and 'Time zone offset:' with a dropdown menu showing '(GMT-12:00) International Date Line West'. At the bottom center of the page is a green circular icon with a white checkmark and the word 'Apply' below it.

Select from the list of NTP (Network Time Protocol) time servers. Then select the time zone that you are in and click on **Apply** to save.

Remote Log

The Log dialog allows you to view and configure the log. To view the log, click on the **View System Log** button.

Below is the **System Log** screen which shows the date/time of the log, the facility that was logged, the severity level and the log message. Click on **Refresh** to view any new information that is logged.

System Log when log mode is DISABLED →

NOTE: When you click on the **View System Log** button, the **System Log** screen that you access will be located under the **Status** section (see screen on left). To return to the previous screen to configure system log, remember to click on the **Tools** tab (located on top row) first and then click on **Remotelog**.

System Log when log mode is ENABLED →

To configure the system log settings, click on the **Configure System Log** button to view the following screen.

Home | **Advanced** | **Tools** | **Status**

System Log -- Configuration

If the log mode is enabled, the system will begin to log all the selected events. For the Log Level, all events above or equal to the selected level will be logged. For the Display Level, all logged events above or equal to the selected level will be displayed. If the selected mode is 'Remote' or 'Both,' events will be sent to the specified IP address and UDP port of the remote syslog server. If the selected mode is 'Local' or 'Both,' events will be recorded in the local memory.

Select the desired values and click 'Apply' to configure the system log options.

Log: Disable Enable

Log Level:

Display Level:

Mode:

 **Apply**

If the log is enabled, the system will log selected events including *Emergency*, *Alert*, *Critical*, *Error*, *Warning*, *Notice*, *Informational*, and *Debugging*. All events above or equal to the selected log level will be logged and displayed.

If the selected mode is "Remote" or "Both", events will be sent to the specified IP address and UDP port of a remote system log server. If the selected mode is "Local" or "Both", events will be recorded in the local memory. Select the desired values and click on **Apply** to configure the system log options.

TR-069 Client

The router includes a TR-069 client, a WAN management protocol. All the values are already filled in. If you wish to enable this protocol, then select *enable*. You must click on the **Apply** button for the setting to take place.

TR-069 client - Configuration

WAN Management Protocol (TR-069) allows a Auto-Configuration Server (ACS) to perform auto-configuration, provision, collection, and diagnostics to this device.

Select the desired values and click "Apply" to configure the TR-069 client options.

System

The system section includes several tools on one page, including save and reboot, backup settings, update settings, and restore default settings.

Save and Reboot

To save all configurations made, click on the **Save/Reboot** button. This will save all your settings and restart the router for the settings to take effect.

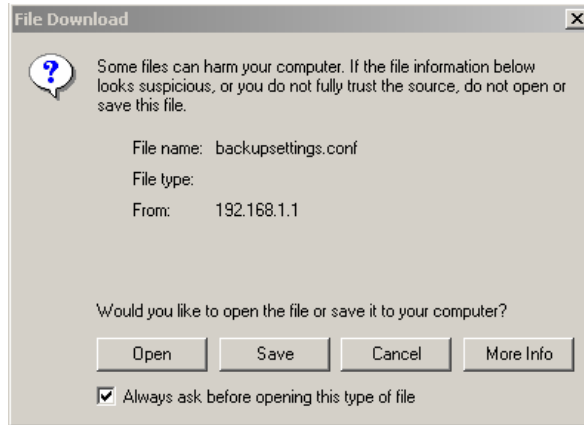

When completed, the below pop-up window will appear confirmation that the router has been rebooted.

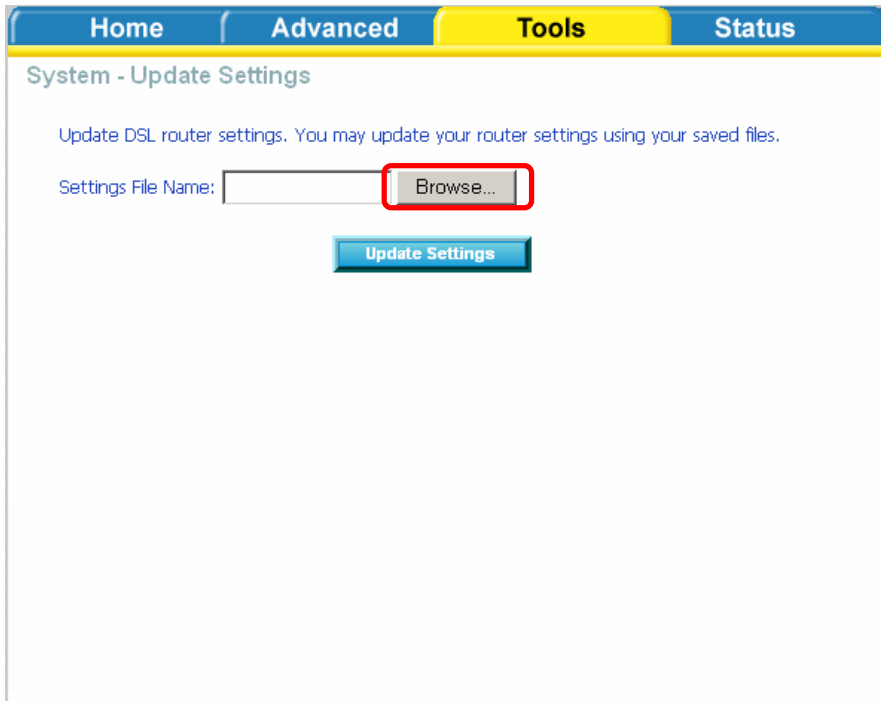

Backup Settings

To save your configurations in a file on your computer so that it may be accessed again later if your current settings are changed, click on the **Backup Settings** button. The below pop-up screen will appear with a prompt to open or save the file to your computer.

Update Settings

To load a previously saved configuration file onto your router, click **Browse** and select the file on your computer and then click on **Update Settings**.

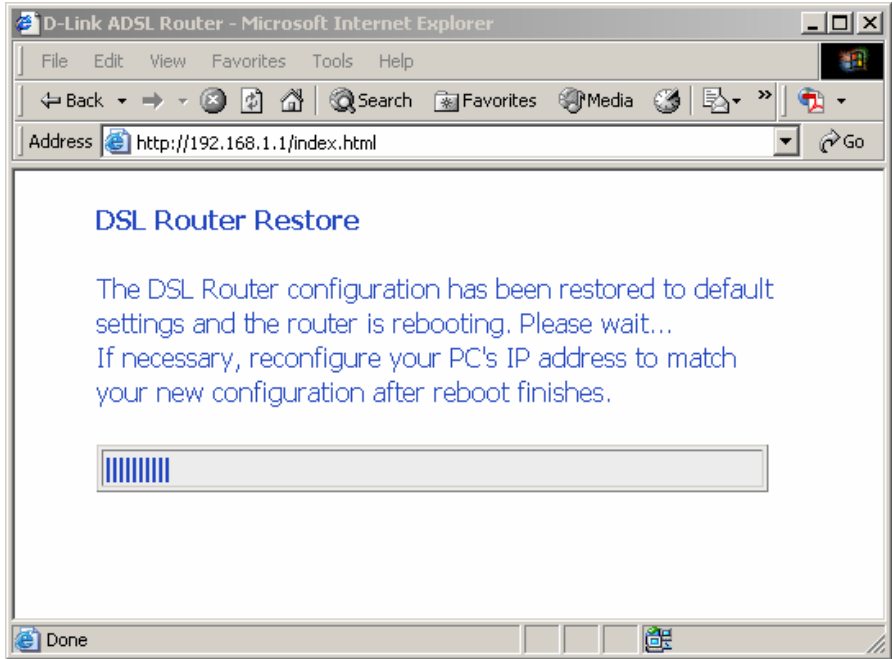

The router will restore settings and reboot to activate the restored settings.

Restore Default Settings

Restore Default will delete all current settings and restore the router to factory default settings. Click on the **Restore Default Settings** button to proceed. The following confirmation dialog will appear confirming your decision to restore default settings. Click on **OK** to continue.

Click on the OK button to start. The below screen will appear with the progress of restoring the default settings.

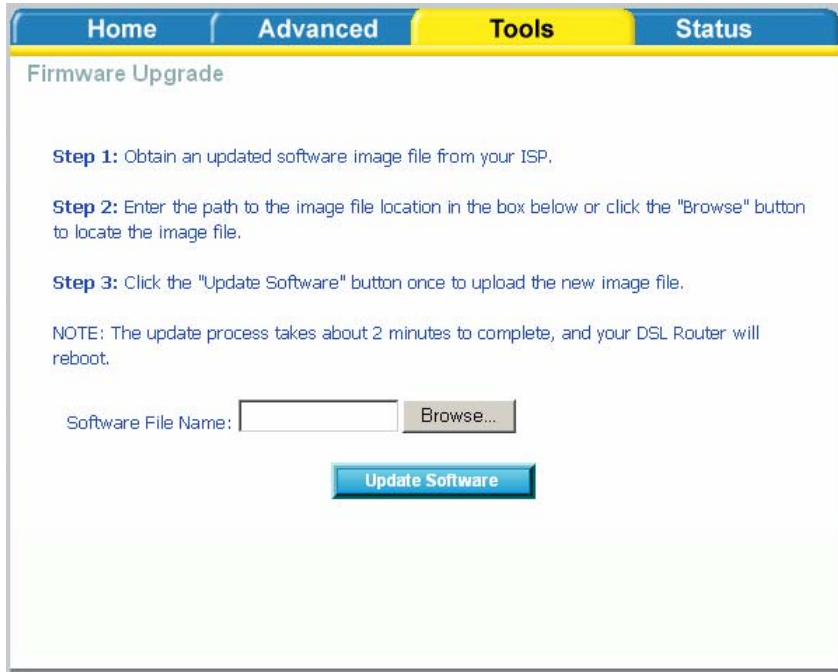

When completed, the below pop-up window will appear confirmation that the router has been rebooted.

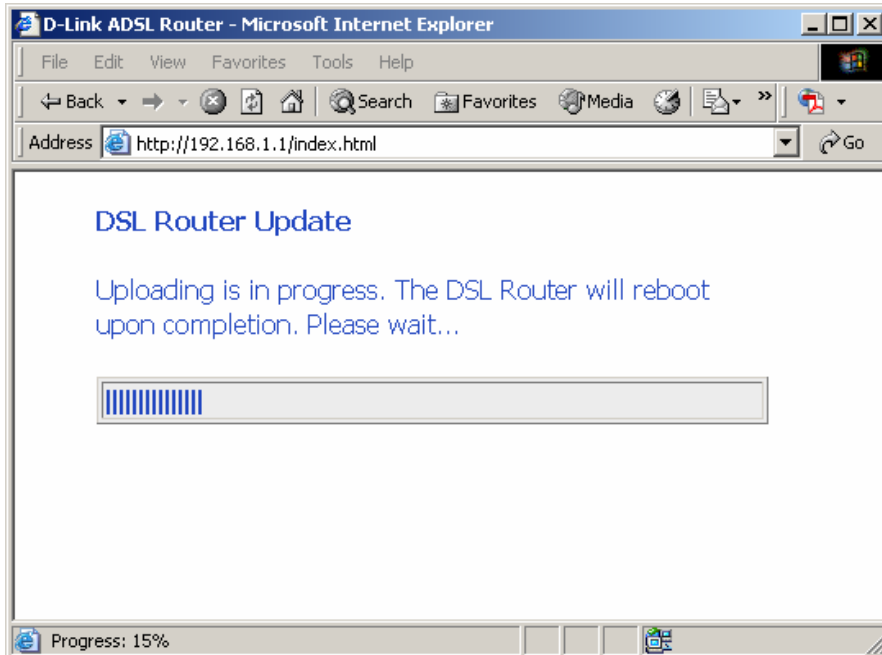

Firmware

If your ISP releases new software for this router, follow these steps to perform an upgrade.

1. Obtain an updated software image file from your ISP.
2. Enter the path to the image file location or click on the **Browse** button to locate the image file.
3. Click the **Update Software** button once to upload the new image file.

The below page will appear when you click on the **Update Software** button.

When completed, the below pop-up window will appear confirmation that the router has been rebooted.

Test

The diagnostics screen allows you to run diagnostic tests to check your DSL connection. The results will show test results of three connections—

- Connection to your local network
- Connection to your DSL service provider
- Connection to your Internet service provider

There are three buttons at the bottom of the page—**Next Connection** (appears only if you have created more than one connection), **Test** and **Test with OAM F4**—which will allow you to retest if necessary.

pppoe_0_35_1 Diagnostics

Your modem is capable of testing your DSL connection. The individual tests are listed below. If a test displays a fail status, click "Rerun Diagnostic Tests" at the bottom of this page to make sure the fail status is consistent. If the test continues to fail, click "Help" and follow the troubleshooting procedures.

Test the connection to your local network

Test your ENET Connection:	PASS	Help
Test your Wireless Connection:	PASS	Help

Test the connection to your DSL service provider

Test ADSL Synchronization:	FAIL	Help
Test ATM OAM F5 segment ping:	FAIL	Help
Test ATM OAM F5 end-to-end ping:	FAIL	Help

Test the connection to your Internet service provider

Test PPP server session:	FAIL	Help
Test authentication with ISP:	N/A	Help
Test the assigned IP address:	FAIL	Help
Ping default gateway:	FAIL	Help
Ping primary Domain Name Server:	FAIL	Help

Status

The status section allows you to view general and status information for your router's connection.

Device Info

It shows details of the router such as the version of the software, bootloader, LAN IP address, etc. It also displays the current status of your DSL connection as shown below—

The screenshot shows the D-Link DSL-2640U web interface. The top navigation bar includes 'Home', 'Advanced', 'Tools', and 'Status' (highlighted in yellow). The left sidebar contains various menu items: 'Device Info' (highlighted in yellow), 'DHCP Clients', 'WAN Info', 'Route Info', 'Log', 'LAN', 'WAN', 'ATM', 'ADSL', 'Wireless Station Info', and 'Logout'. The main content area is titled 'DSL-2640U' and 'Device Info'. It contains two tables: one for device specifications and one for DSL connection status.

Board ID:	D-4P-W
Software Version:	RU_DSL-2640U_3-06-04-1C00.A2pB021c.d19b
Bootloader (CFE) Version:	1.0.37-6.5
Wireless Driver Version:	3.131.35.0.cpe2.3

This information reflects the current status of your DSL connection.

Line Rate - Upstream (Kbps):	
Line Rate - Downstream (Kbps):	
LAN IP Address:	192.168.1.1
Default Gateway:	
Primary DNS Server:	192.168.1.1
Secondary DNS Server:	192.168.1.1

DHCP Clients

Access the DHCP Leases screen by clicking "DHCP" under "Statistics". This shows the computers, identified by the hostname and MAC address that have acquired IP addresses by the DHCP server with the time that the lease for the IP address is up.

Home	Advanced	Tools	Status
Device Info -- DHCP Leases			
Hostname	MAC Address	IP Address	Expires In

WAN Info

The WAN Info screen displays WAN connections previously set up in the Home section. The information added in the status section is the extra column for connection status information, displaying either *ADSL Link Down* or *ADSL Link Up*.

Home		Advanced		Tools		Status	
WAN Info							
VPI/VCI	Category	Service Name	Interface Name	Protocol	State	Status	IP Address
0/35	UBR	ppp0a_0_35_1	ppp_0_35_1	PPPoA	Enabled	ADSL Link Down	
2/38	UBR	pppoe_2_38_1	ppp_2_38_1	PPPoE	Enabled	ADSL Link Down	

Route Info

The Route Info section displays route information showing the IP addresses of the destination, gateway, and subnet mask as well as other route information.

Home		Advanced		Tools		Status	
Device Info -- Route							
Flags: U - up, I - reject, G - gateway, H - host, R - reinstate D - dynamic (redirect), M - modified (redirect).							
Destination	Gateway	Subnet Mask	Flags	Metric	Service	Interface	
192.168.1.0	0.0.0.0	255.255.255.0	U	0		br0	

Log

This is the same screen as seen in the Remotelog section under tools.

The screenshot shows a web interface with a navigation bar at the top containing four tabs: Home, Advanced, Tools, and Status. The Status tab is highlighted in yellow. Below the navigation bar, the page title is "System Log". A table displays log entries with columns for Date/Time, Facility, Severity, and Message. Two entries are visible: one from syslog with severity emerg, and another from user with severity crit. A Refresh button is located below the table.

Date/Time	Facility	Severity	Message
Jan 1 00:12:36	syslog	emerg	BCM96345 started: BusyBox v1.03 (2005.04.12-18:11+0000)
Jan 1 00:12:36	user	crit	kernel: eth0 Link UP.

[ADSL BER Test](#)
[Reset Statistics](#)

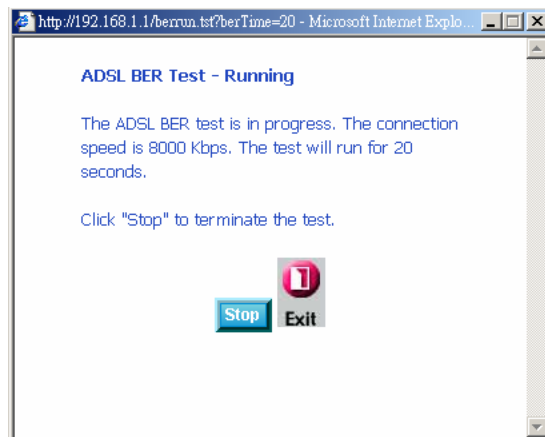

ADSL BER Test

A Bit Error Rate Test (BER Test) is a test that reflects the ratio of error bits to the total number transmitted.

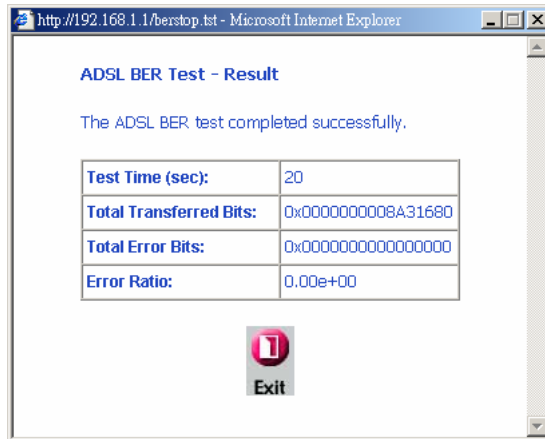

If you click on the **ADSL BER Test** button at the bottom of the ADSL Statistics page, the following pop-up screen will appear allowing you to set the tested time and to begin the test.

When you start the ADSL BER Test, the following progress window will display the connection speed as well as the length of time that the test will run for. At any time during the test, click on the **Stop** button to terminate the test.

When the test is complete, the following window will display the test results showing the test time, total transferred bits, total error bits and error ratio.

Wireless Station Info

This page displays the stations (identified by their BSSID) that are associated with your wireless router. Click on Refresh to renew the page for new wireless stations.
