Introduction

D-Link strives to provide easy-to-use devices and software for users. Networking is a core technology for data communication. Based on abundant experience and profound understanding on end-user network management requirements, D-Link introduces D-View 7. Network administrators can now efficiently manage and monitor, device configuration, fault tolerance, performance, and security of multiple networks and management switches with D-View 7, a Simple Network Management Protocol (SNMP) Network Management System.

This is a comprehensive standards-based management tool designed to centrally manage critical network characteristics such as availability, reliability and resilience in a consistent manner. D-View accommodates a wide range of devices including:

- Wireless AP
- Wireless Controller
- Unified AP
- Unified Switch
- Smart / Managed Switches
- Other SNMP supported devices

This guide does not discuss network design, management concepts or provide detailed explanations of SNMP, MIB, RMON and associated concepts. We assume the reader is familiar with these networking concepts; hence variables defined in D-View menus are self-explanatory.

About This Document

Scope

Use this document to learn, use, and configure the different features of D-View 7.

Audience

This document is written for network managers, system administrators, and/or IT personnel who would need to work with D-View 7.

Document Conventions

Reader Alert Conventions

Reader alerts are used throughout this document to notify the reader of essential information. The following table explains the meaning of each alert.

Reader Alert	Meaning
	Alerts to supplementary information that is not essential to the completion of the task at hand.
	Alerts to supplementary information.

Style Conventions

The following table explains the meaning of each style convention used in this guide.

Style Element	Meaning
Bold font	Use for describing user interface elements and characters that need to be typed into the interface. For example, Hierarchy Topology Workplace and type <code>http://192.168.1.1</code> .
<i>Italic font</i>	Variables for which the reader must supply a specific value. For example: <i>Filename.ext</i> can refer to any valid file name.
Courier New font	Samples of code and file paths and names.
Courier New Bold font	A command that is typed at the command prompt. For example, ipconfig .

Available License

After installing D-View, the trial version is automatically activated and allows evaluation of the product with a full feature set with no expiration date. The trial version includes support for 25 nodes and 2 probes. Additional licenses can be purchased and added at any time. Added licenses are accumulated, and there is no expiration date on additional license. Licenses are sold in electronic packs for adding additional nodes, or additional probes. The two types of licenses are different and need to be purchased separately.

A node is any SNMP devices discovered in D-View 7. The node license determines how many devices the D-View 7 can manage.

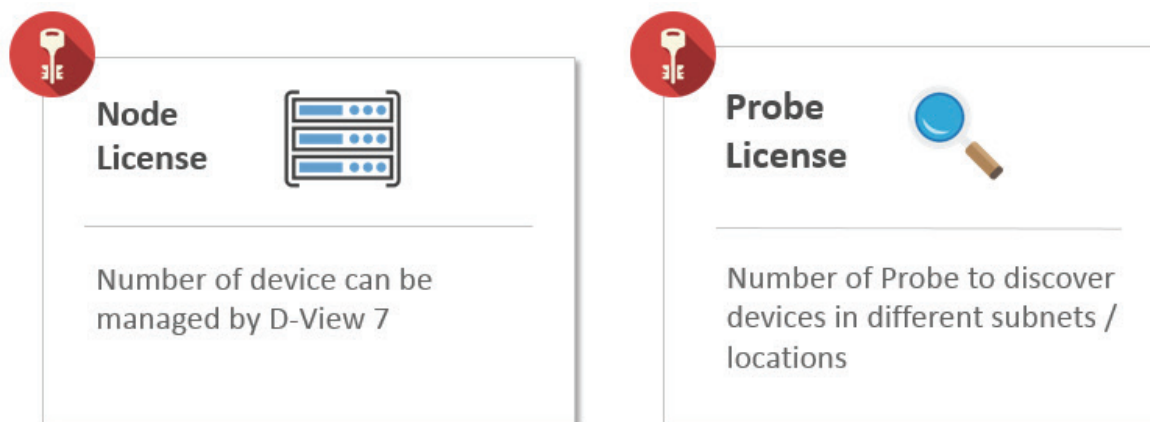

A probe is the remote agent which communicates between the D-View 7 server and devices. The probe license determines how many probes a D-View 7 server can use to communicate with devices from different subnets.

An example for a need to purchase additional licenses would be;

- 1) A single location has 290 nodes that need to be monitored. In this example an additional 250 node license pack, and a 25 node license pack could be combined with the default free 25 node licenses to allow up to 300 nodes.
- 2) Four separate locations each have 5 nodes. In this example an additional 5 probe license pack could be combined with the default free 2 probe license to allow up to 7 probes, that could discover a total of 25 nodes (the default 25 node licenses included with D-View 7).

To find out more about how to activate additional licenses on the D-View 7 server, please see **Activation** on page 51.

To find out more about how to manage additional licenses on the D-View 7 server, please see **License** on page 96.

System Requirements

Server

- CPU Dual core, 3.0 GHz or above
- RAM 8 GB or above
- Hard disk 120 GB or above (depends on the number of devices managed)
'C' drive for core server
'D' drive for MongoDB database
- OS Windows 7 64-bit (English version, Professional Edition or above)
Windows 8 64-bit (English version, Professional Edition or above)
Windows 8.1 64-bit (English version, Professional Edition or above)
Windows 10 64-bit (English version, Professional Edition or above)
Windows Server 2008 R2 64-bit (English version, Standard Edition or above)
Windows Server 2012 64-bit (English version, Standard Edition or above)

Probe

- CPU Single core, 2.0 GHz or above
- RAM 2 GB or above
- OS Windows XP 32 or 64-bit
Windows 7, 32 or 64-bit (English version)
Windows 8, 32 or 64-bit (English version)
Windows 8.1, 32 or 64-bit (English version)
Windows 10, 32 or 64-bit (English version)
Windows Server 2008 32 or 64-bit (English version, Standard Edition or above)
Windows Server 2008 R2 64-bit (English version, Standard Edition or above)
Windows Server 2012 64-bit (English version, Standard Edition or above)

Client

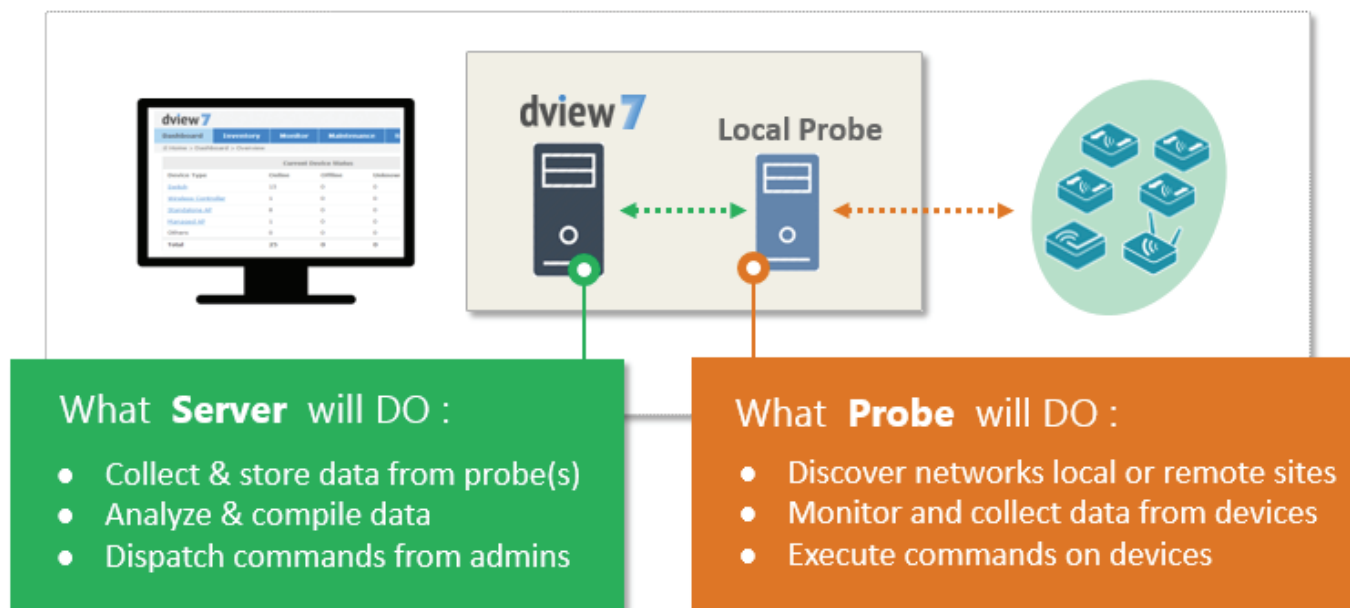

- CPU Single Core 2.0 GHz or above
- RAM 2 GB or above
- Browser Chrome, Firefox, and IE 10 or above

Understanding Basic D-View Concepts

D-View 7 has been redesigned to utilize a more streamlined server and probe architecture. Each component has a fundamental role, and they work together to give network administrators a greater level of control and management ability over the network.

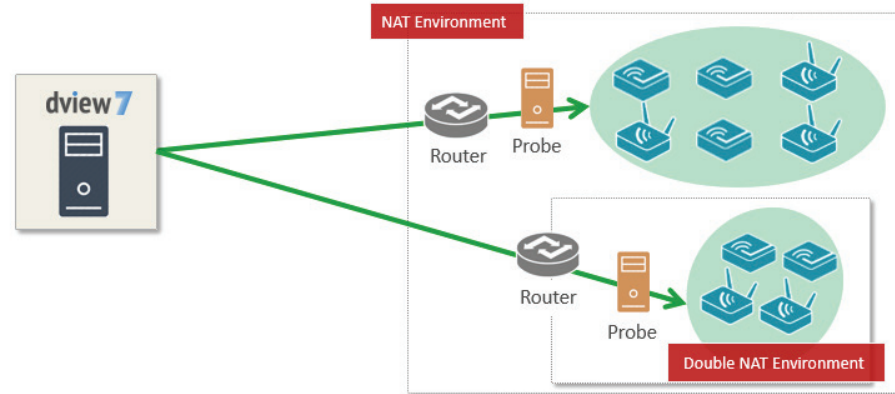

The D-View 7 server is responsible for collecting and storing data that it receives from various probes. It analyzes and compiles the data received and presents it in easy to understand graphs or data views. The server also acts a centralized command center, allowing network administrators to target specific devices or network segments and perform maintenance and administration without any complicated setup.

A probe is used to collect data from SNMP devices, issue command to devices, and communicate with core server. After installing D-View 7, it will have an embedded local probe but an administrator can install additional probes if needed. Probes allows administrators to effectively monitor parts of networks that would otherwise be inaccessible due to firewalls, NAT, or a complicated network environment what make devices hard to access through SNMP.

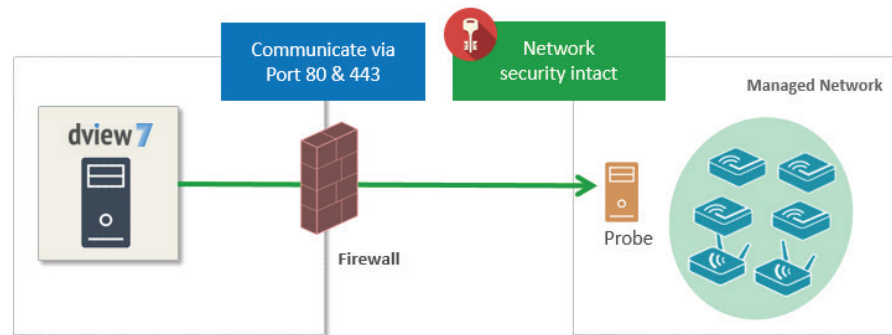

D-View 7 Server

Utilizing the server-probe architecture enables D-View 7 to get a view of the overall network topology versus traditional network management systems. Deploying probes in network segments that would otherwise be inaccessible from the outside allows network administrators to gain full control of networked resources without having to reconfigure the network in a way that could potentially be not secure.

The server-probe architecture also facilitates a more secure networking environment by eliminating the need to have unnecessary ports open for each segment of the network that needs to be monitored. By deploying a probe within the desired network segment, certain ports such as SNMP, traps, or others that could potentially be exploited are no longer required to be exposed. D-View 7 leverages HTTP and HTTPS to communicate securely, using standardized communication protocols that leave network security policies intact.

When probes try to connect to the core server, they will try to use HTTPS first. Depending on how IIS has been set up, if HTTPS is enabled, then communication between the core server and probes will be in HTTPS. If IIS has not been set up, then a HTTP connection will be used instead.

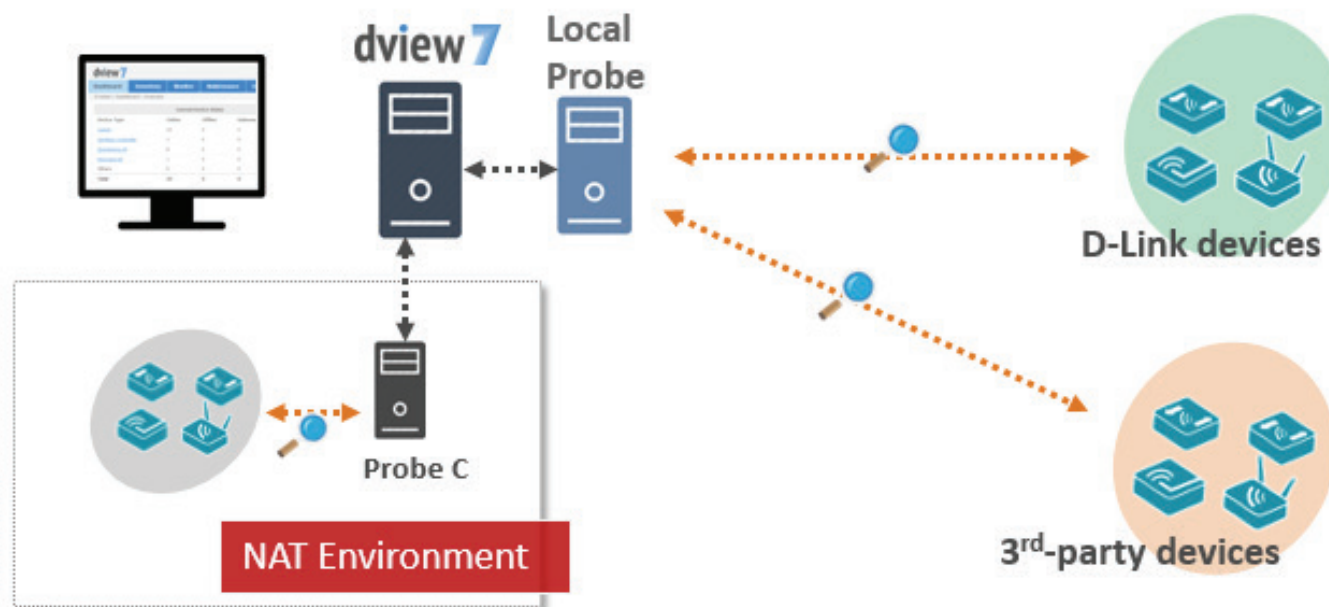

Probe

D-View 7 probes are the primary component in connecting networking devices with the D-View 7 server. Probes run as a background process, performing network discovery for new devices, polling existing devices for statistics data, and acting as a staging point for forwarding data to the D-View server for networks behind a firewall or in a NAT environment.

Probes for D-View 7 are not limited to D-Link products, and will communicate with any network device that supports industry standard reporting protocols based on SNMP.

Deploying individual probes for a particular network segment helps to alleviate bandwidth constraints, as that data is collected by the probe before being forwarded to the D-View 7 server to be compiled and analyzed. This reduces network overhead by reducing the number of open connections, and the need to have all of the devices communicating directly with the server. Separating network devices into groups also becomes easier as identification based on a number of criteria can more easily be applied for a given network topology.

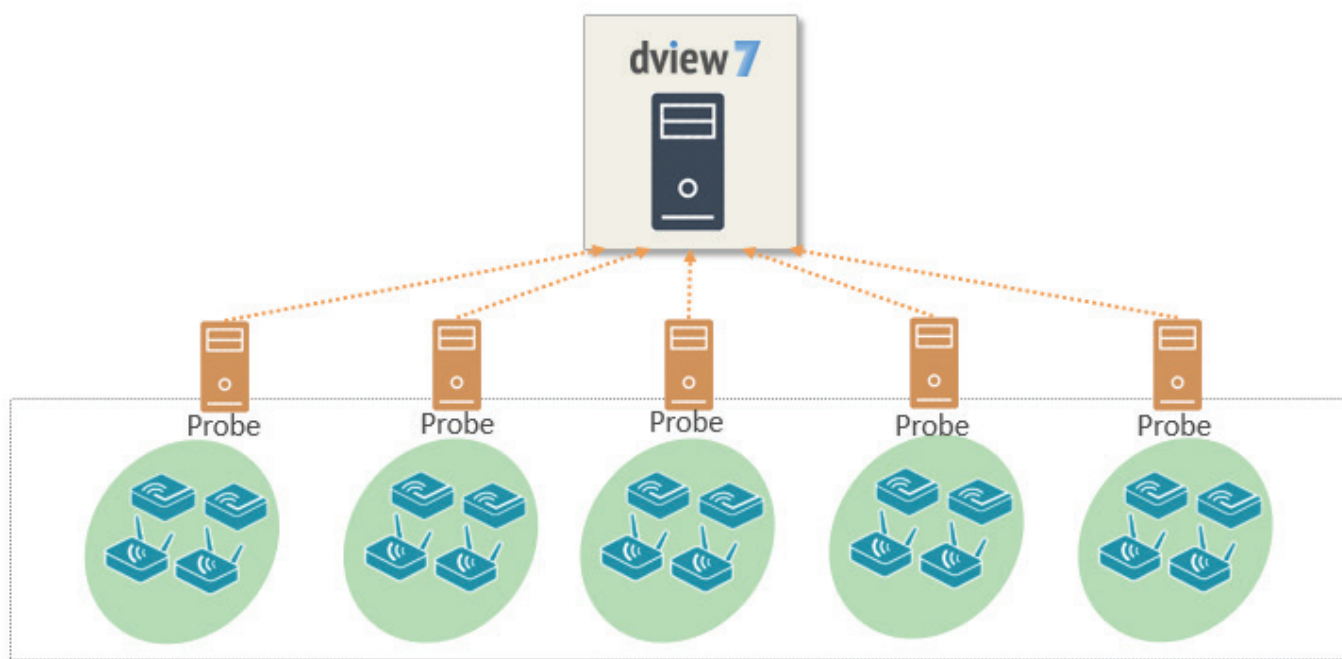

Probes are also responsible for executing commands received from the D-View 7 administrator on devices that are directly connected to the probe. Examples of this would be performing a reboot, managing event logs, or making changes to a configuration on a device.

Sensor

D-View 7 comes preconfigured with a number of sensors that can be used to gather network statistics. Sensors can also be customized down to the device level in order to give network administrators up-to-date information based on any number of criteria. Administrators can log into the D-View 7 server and use the sensor setup wizard to specify a metric such as CPU utilization, and then assign the sensor to any number of devices, groups, or whole network segments. Sensors will then be deployed to the device dashboard, and will gather the necessary information in real-time, updating at specified intervals, and storing the analyzed data for historical reporting.

Sensors can also be assigned to separate workspaces within D-View 7, allowing administrators to create different network environments based on access controls built into D-View 7. This will help to create different workspaces for different teams based on the same number of devices and network topology, but enable different teams to focus on what matters.

Databases

The D-View 7 backend is built on MongoDB, a document-oriented NoSQL database. MongoDB is made available under the GNU AGPL v3.0 license and the driver is based on Apache License v2.0. The aim of MongoDB is to provide a database that delivers high performance, high availability, and automatic scaling.

Some of the key features of MongoDB are;

- Support for embedded data models reduces I/O activity on database system.
- Indexes support faster queries and can include keys from embedded documents and arrays.
- Provide automatic failover.
- Provide data redundancy.
- Automatic sharding distributes data across a cluster of machines.
- Replica sets can provide eventually-consistent reads for low-latency high throughput deployments.

To find out more information about MongoDB, please visit the main MongoDB website at <http://www.mongodb.org>

<http://docs.mongodb.org/manual/administration/production-notes/>

Note: For production environments, please ensure that D-View 7 and MongoDB are installed onto a 64-bit operating system.

High Availability

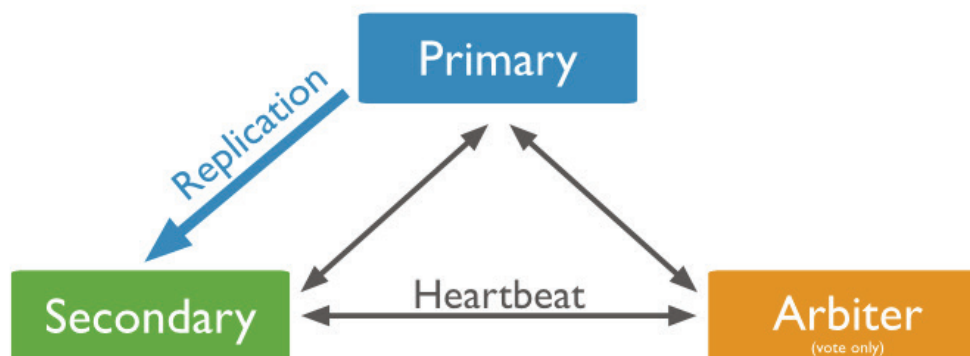

D-View 7 includes a High Availability (HA) deployment type, and this can be used to reduce the load on one server, while increasing the reliability of the system by being able to survive failures. Both D-View 7 and MongoDB can be installed in a HA deployment type, providing fault tolerance and allowing individual nodes to be taken offline without impacting the network.

D-View 7 can be installed in two HA deployment types:

1. Single MongoDB instance with multiple D-View 7 instances
2. Multiple MongoDB instances with multiple D-View 7 instances

The HA system works by using the in-built Windows Server Network Load Balancing (NLB) tool, and clients connect to the D-View 7 cluster using a cluster IP, which both hosts in the cluster respond to. The D-View 7 Core Server, D-View 7 License Agent server, D-View 7 Probe server, D-View 7 Probe File Server services are activated on the master server, and the slave servers only run the D-View 7 Core Server service. Both D-View 7 servers are pointed at a MongoDB instance, which can be installed on a single server or in a HA deployment type.

MongoDB can be deployed either as a single server or in a cluster. If deployed in the cluster mode, there is one primary server and multiple secondary servers, with an optional arbiter server. The primary server can read and write to the database, whereas the secondary servers can only read the database. In the event of a failure, the secondary server becomes the primary server, and if there are an even number of secondary servers, an arbiter server can be used to manage the election process.

If a HA deployment type is required for MongoDB, D-Link recommend that a primary and secondary MongoDB server are installed, along with an arbiter server. This does not require dedicated hardware, and can be installed on any host that is in the same subnet and is directly reachable using the local network.

D-View 7 Setup and Configuration

To install D-View 7, please make sure that you meet the following requirements:

- You have the correct number of hosts for your deployment type (single server or multiple servers/HA deployment)
- The hosts meet the server requirements in the System Requirements section
- The hosts are connected to a network with Internet access

Additionally, the following components are also needed. If any of the below components are not present at the time of the D-View 7 installation, the installation wizard will install them.

- IIS
- .NET Framework 4.0
- Windows Firewall is enabled
- ASP, ASP.NET, ISAPI Extensions, and ISAPI Filters are installed
- MongoDB

To begin the installation process, download the D-View 7 setup application from the D-View website. After the download has completed, double-click the setup application to begin.

The setup application installs all of the necessary components for trial mode. This has all of the features as a licensed D-View 7 server, but is limited to 25 nodes and 2 probes. To learn more about licensing and the activation, please refer to **Activation** on page 51.

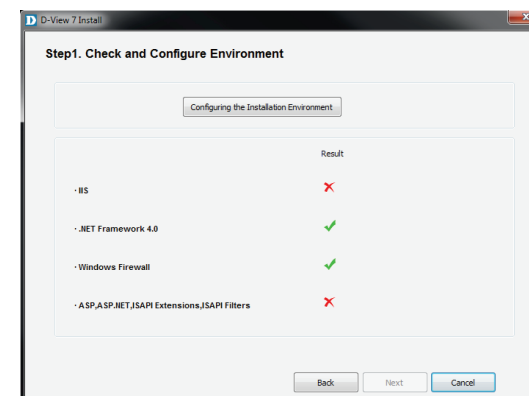

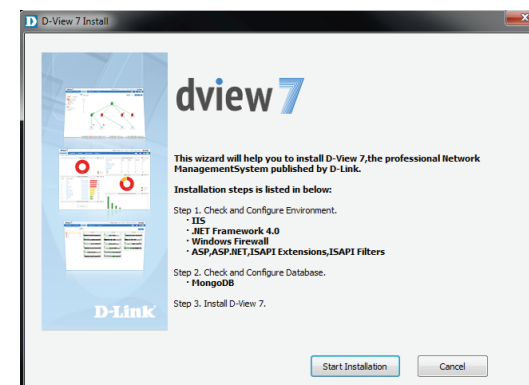

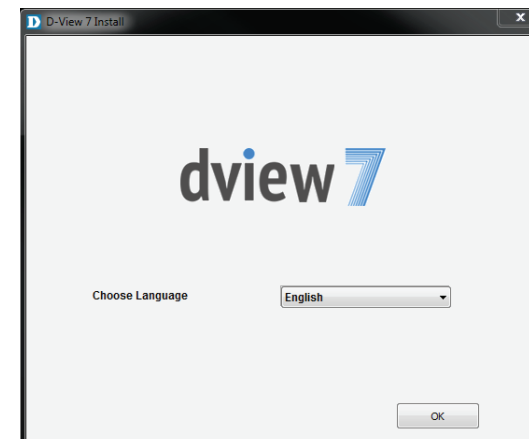

Installation (Single Server)

After double-clicking the setup application file, the installation wizard will start. Select the preferred language to install. Currently D-View 7 supports the following languages:

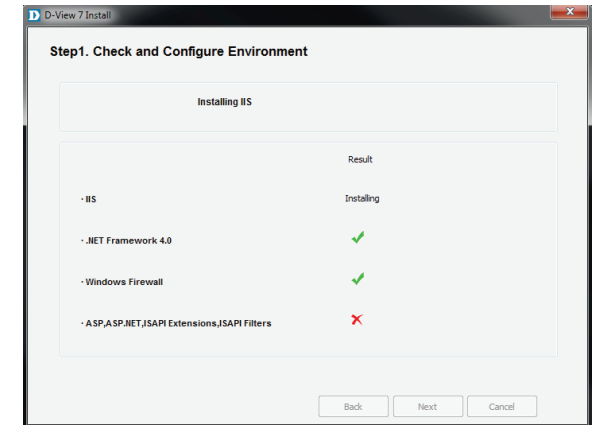

- English
- Simplified Chinese
- Traditional Chinese

After selecting the preferred installation language, D-View 7 will check to make sure that the necessary components needed to run are installed and properly configured. Click **Start Installation** to continue.

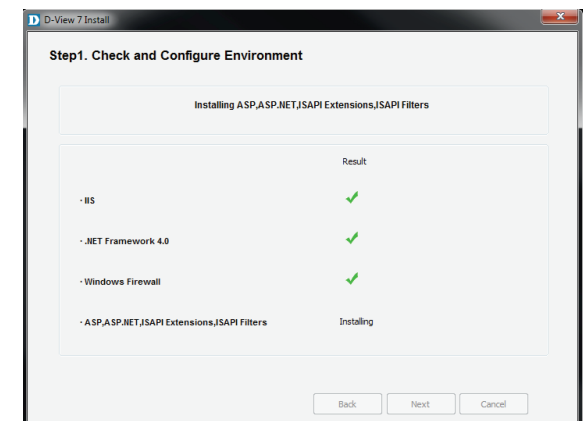

If D-View 7 detects that any components are not present or configured properly, it can attempt to download, install, and configure the missing components. Missing or improperly configured components will have a red X listed next to their name. Click **Configuring the Installation Environment** to have D-View attempt to fix any issues.

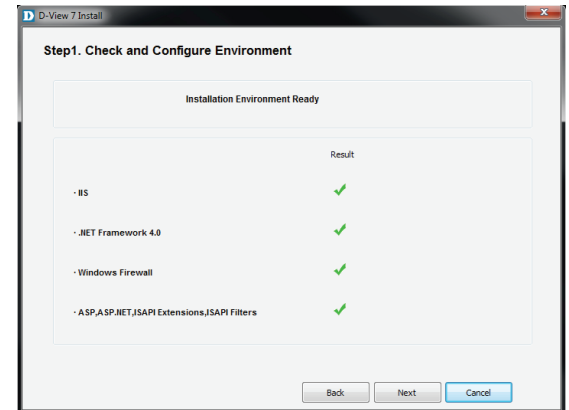

The D-View 7 setup application will display its current progress for each missing or not properly configured component.

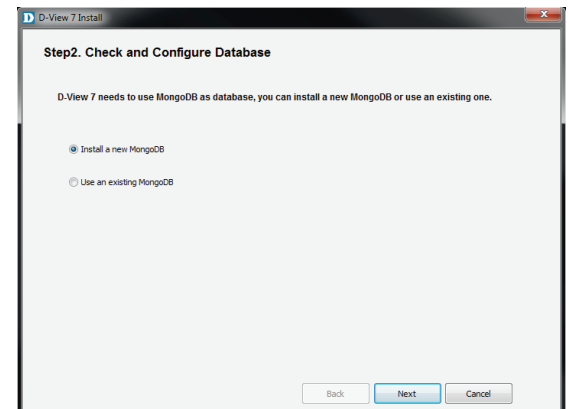

Depending on the speed of the network connection, or if an additional component is already installed but not configured properly, the setup application can take several minutes to complete. If an additional component is already installed, but needs to make changes that might impact other applications, the installation wizard will wait for user confirmation to continue.

After the D-View 7 setup application has completed configuring the system environment, each additional component should have a green checkmark listed next to its name. Click **Next** to continue the installation process.

D-View 7 also requires MongoDB and can either download and install MongoDB, or use an existing MongoDB installation. To continue, choose to either **Install a new MongoDB** or **Use an Existing MongoDB** and then click **Next**.

If D-View 7 will be installed using an existing MongoDB instance, enter the hostname or IP address of the database. An admin level account for the existing MongoDB database is also needed as the D-View 7 installation wizard will need to configure settings to operate properly. Enter the **Username** and **Password** and click **Password Authentication** to verify that the credentials are valid. Once the existing MongoDB credentials have been verified, click **Next** to continue.

Note: When using the MongoDB Tool to upgrade the database from version 2.6.5 to version 3.2.6 or later, leave the **Password Authentication** box unchecked.

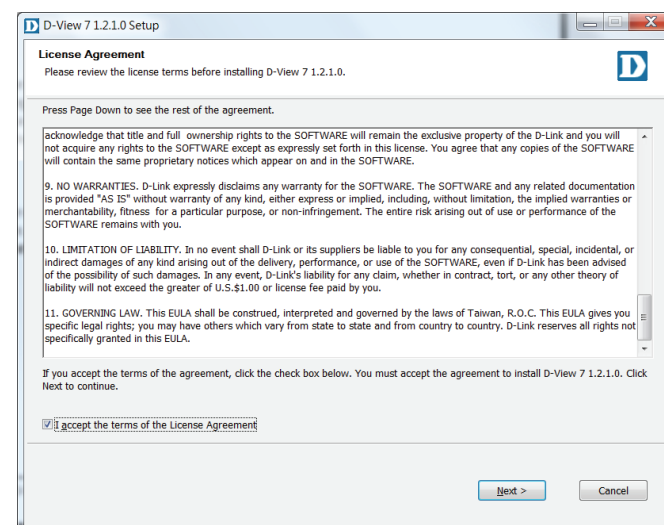

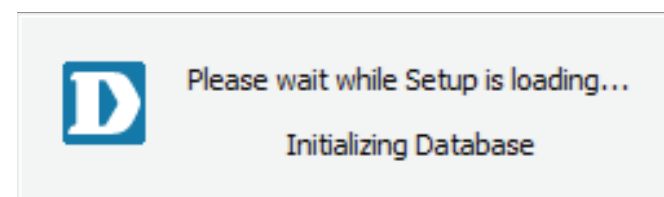

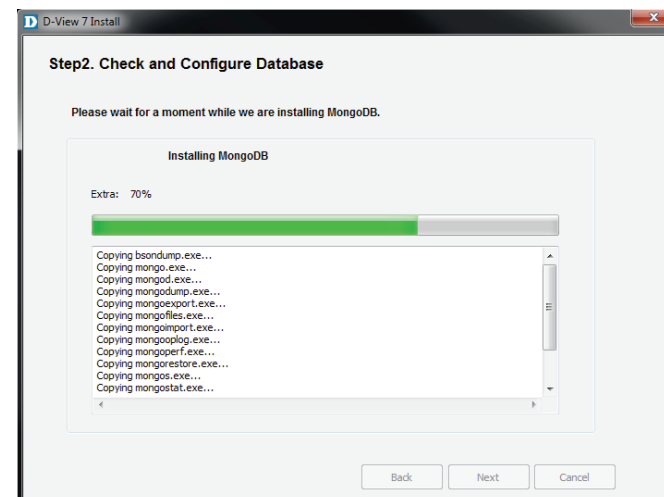

If D-View 7 will be installed with a new MongoDB instance, click **Browse** to navigate to the folder where the MongoDB application will be installed to.

Once the MongoDB installation path has been chosen, and the D-View 7 administrative credentials have been set, click **Next** to continue.

The D-View 7 setup application will continue the installation process by creating the necessary database with the credentials supplied. Depending on the speed of the network connection, or if additional components are needed, the setup application can take several minutes to complete the MongoDB installation process. If D-View 7 needs to make changes that might impact other applications, the installation wizard will wait for user confirmation to continue or not.

Once the D-View 7 setup application has completed the MongoDB installation, it will load the MongoDB service and initialize the D-View 7 database. Depending on whether D-View is using a new or existing database, the initialization process could take several minutes to complete.

After the database has been successfully setup and started, the D-View 7 setup will continue. Accept the software license by checking off the license agreement button, and click **Next** when ready.

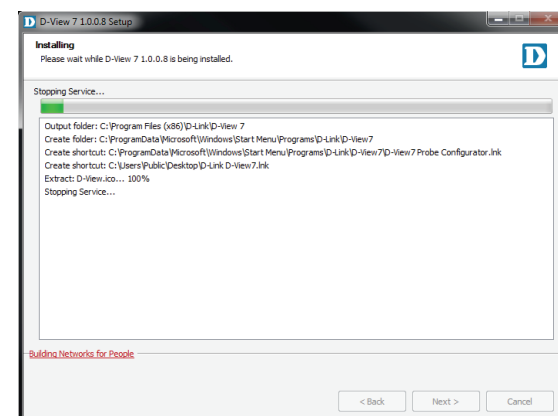

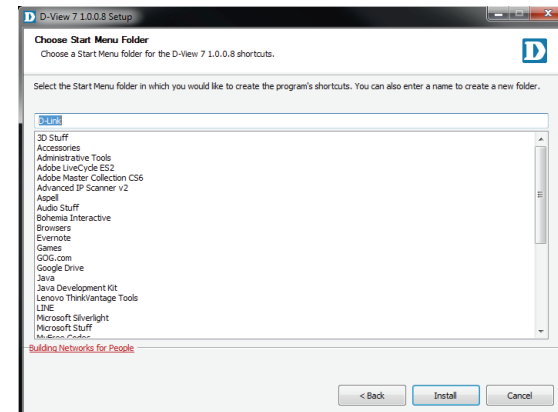

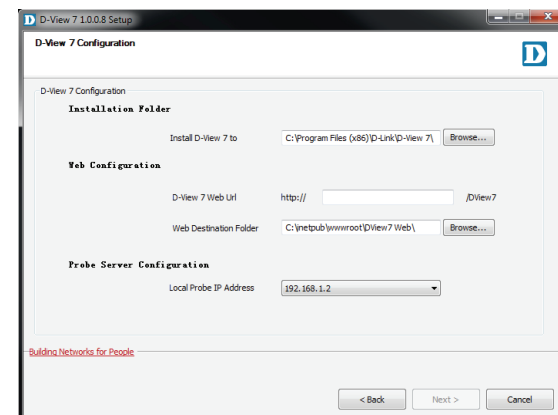

By default, the main D-View 7 application will install itself into the Program Files directory "C:\Program Files\D-Link\D-View 7\". If a different installation path is desired, click **Browse** to navigate to the folder where the D-View 7 application will be installed to. Next, enter the default URL that users will use to access the D-View 7 application. This can be either a hostname such as domainname.com or an IP address such as 192.168.0.100.

The Web Destination Folder is usually "C:\inetpub\wwwroot\DView7 Web\". If a different path for the web site is desired, click **Browse** to navigate to the folder where the D-View 7 web files will be installed to.

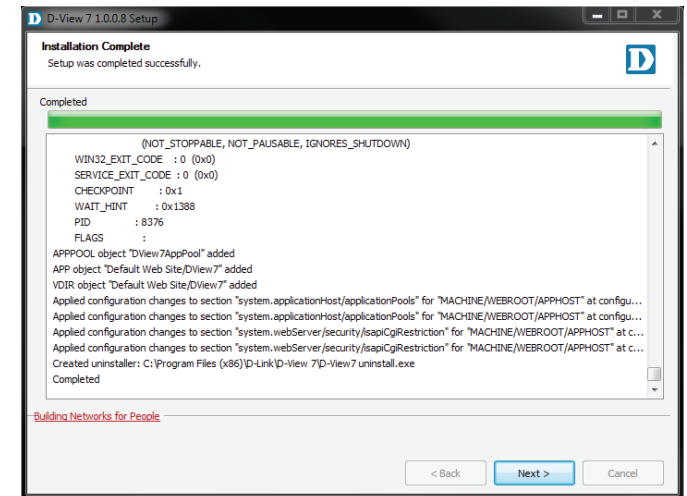

A probe will also be set up for the current subnet that the D-View 7 server is attached to. From the drop down menu, select the correct IP address that the probe will use to determine which subnet to monitor. Click **Next** when ready.

D-View 7 installs shortcuts in the Windows start menu to provide access to the management panel and for uninstallation. If a different path for the shortcut is desired, enter the name of the folder where the D-View 7 shortcuts will be created. Click **Install** when ready.

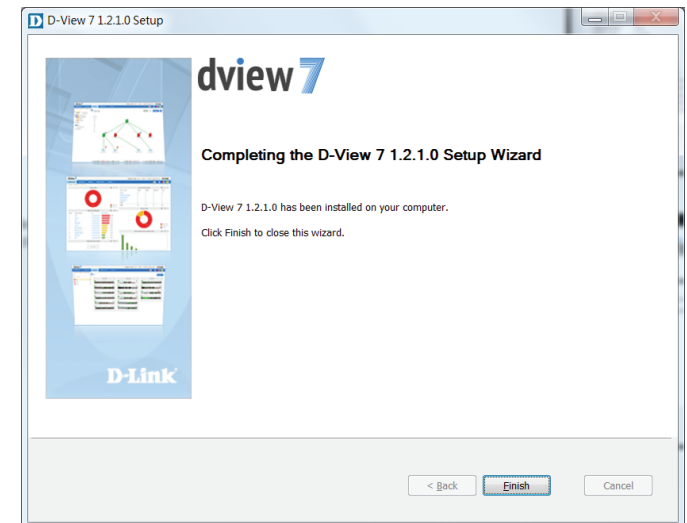

The progress indicator will display how much time is left until the installation process is completed. Depending on the speed of the system, the setup application can take several minutes to complete the installation process.

At the end of the installation process, the setup application will display a summary of all of the changes that were made to the system. Click **Next** to finalize the D-View 7 installation.

The D-View 7 setup is now complete. D-View 7 can now be accessed by typing in "http://<hostname or IP>/DView7/" into any browser.

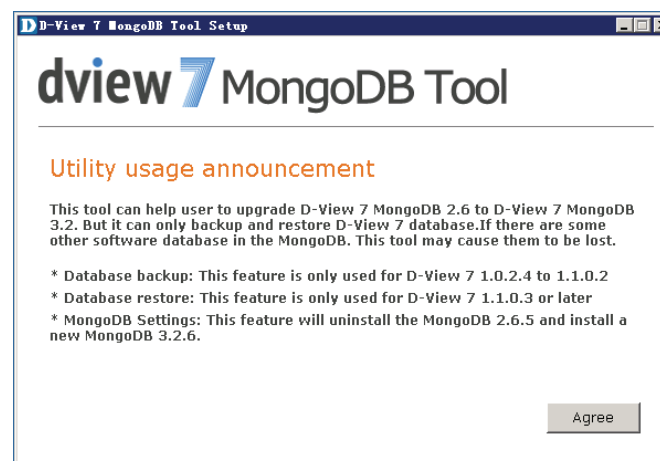

Installation (Multiple D-View 7 Servers, Single MongoDB Server)

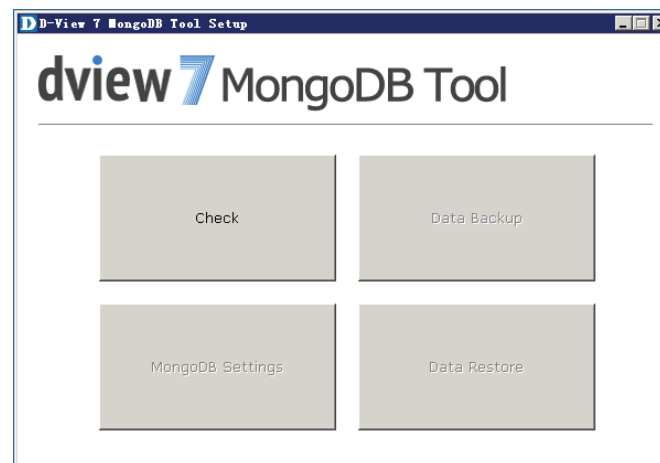

Before beginning with the instructions, please make sure that you have at least two hosts on the same subnet and that are able to reach each other using ICMP ping. Also make sure that the Network Load Balancing (NLB) service is installed and active on both. These will become the D-View 7 servers. You will need at least one additional server for the MongoDB database.

Install MongoDB

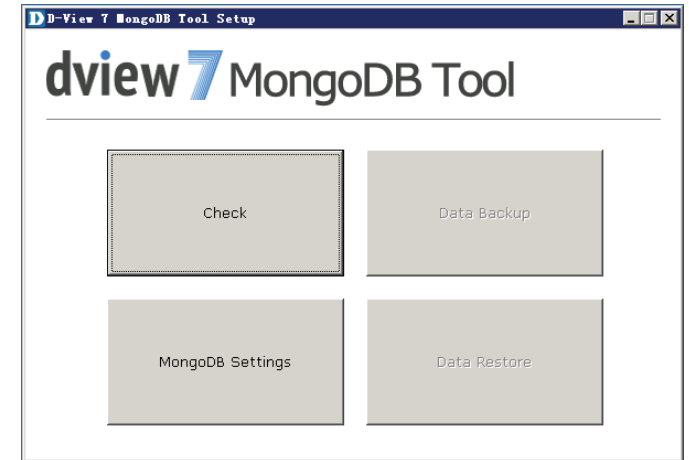

On the MongoDB host, run the MongoDB setup tool. Click Agree when presented with the Utility Usage Announcement, or close the program if you do not agree with the statement.

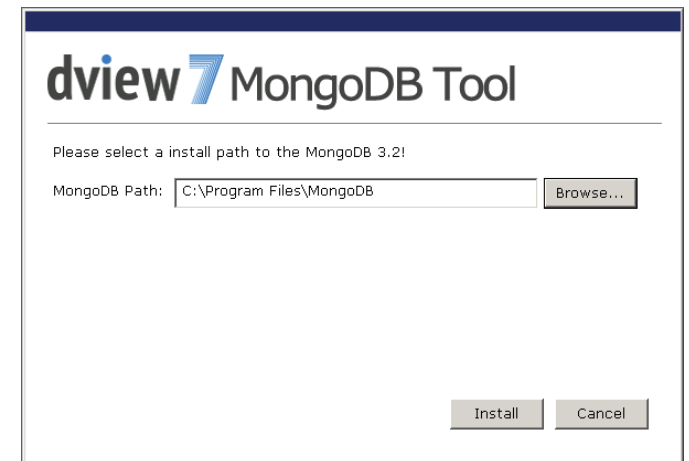

Click the Check button to check whether MongoDB is already installed on the server. If it has been installed, you will be asked if you want to restore a database. If it has not been installed, you will be asked to use the MongoDB Settings button to install MongoDB. Press Cancel to go back to the main screen.

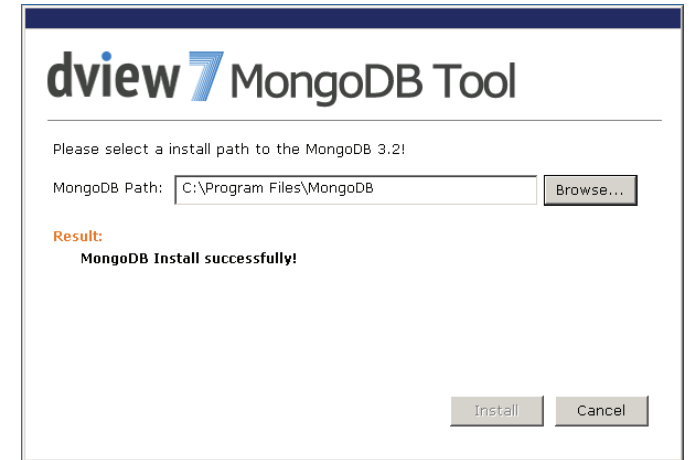

Click the MongoDB Setting button to install MongoDB.

Choose the path that you want to install MongoDB in and press Install to install MongoDB.

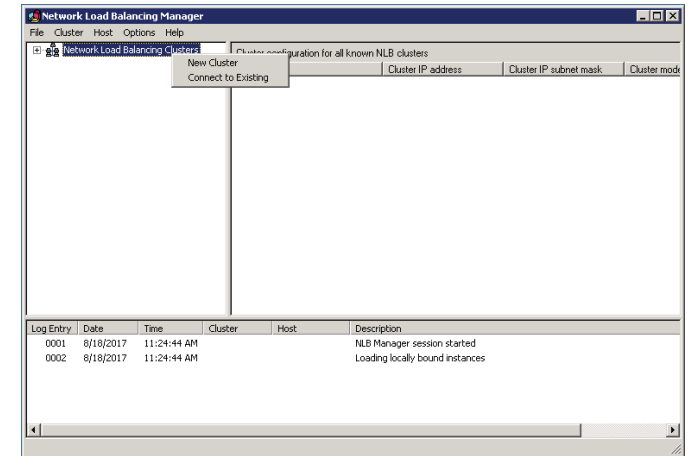

A confirmation message will be displayed when MongoDB has been installed successfully. Press Cancel to return to the main screen and close the tool.

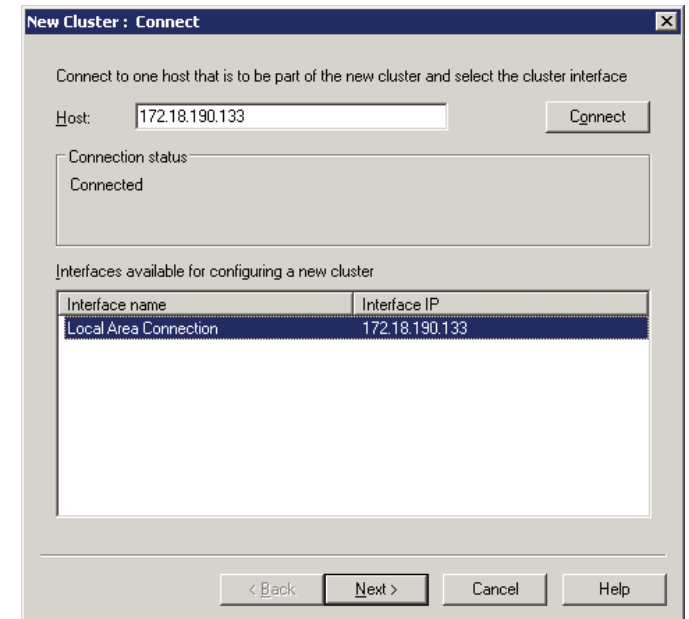

Set up Load Balancing

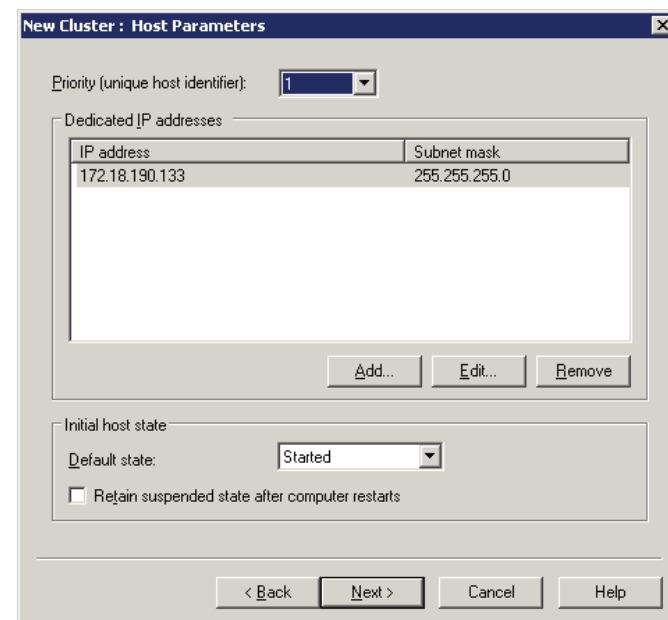

On node 1 in the D-View 7 cluster, open the Network Load Balancing Manager. Right Click "Network Load Balancing Cluster", and then click "New Cluster".

Input the node 1 IP address, and then click Connect. When the Connection status is "Connected", click Next to set the Host Parameters.

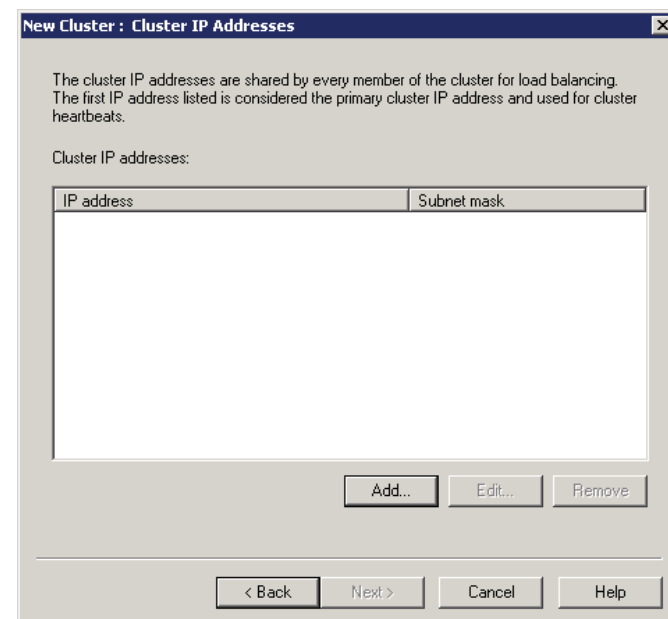

Set the priority of node 1. If the two D-View 7 servers are unequal in terms of performance, give the higher-powered server the lower priority. This will become the master server. Click Next to set the cluster IP addresses.

The "New Cluster: Host Parameters" dialog box is shown. It has a title bar with a close button. The "Priority (unique host identifier):" field is a dropdown menu with "1" selected. Below it is a section titled "Dedicated IP addresses" containing a table with two columns: "IP address" and "Subnet mask". The table has one row with the values "172.18.190.133" and "255.255.255.0". Below the table are three buttons: "Add...", "Edit...", and "Remove". Below the table is a section titled "Initial host state" with a "Default state:" dropdown menu set to "Started" and a checkbox labeled "Retain suspended state after computer restarts" which is unchecked. At the bottom are four buttons: "< Back", "Next >", "Cancel", and "Help".

IP address	Subnet mask
172.18.190.133	255.255.255.0

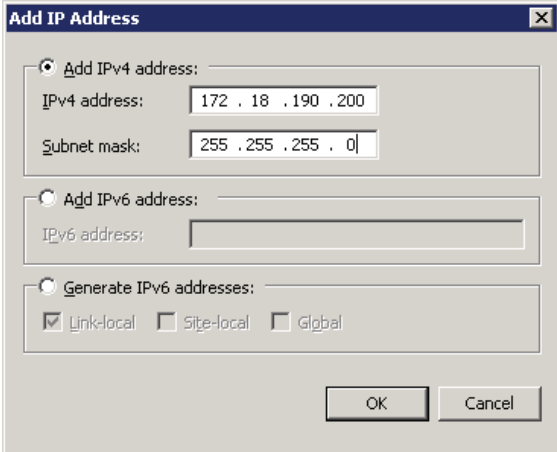

Click Add to add the virtual cluster IP address that the cluster will respond to. Ensure that this address is in the same subnet as the host addresses, and click next to set the Cluster parameters.

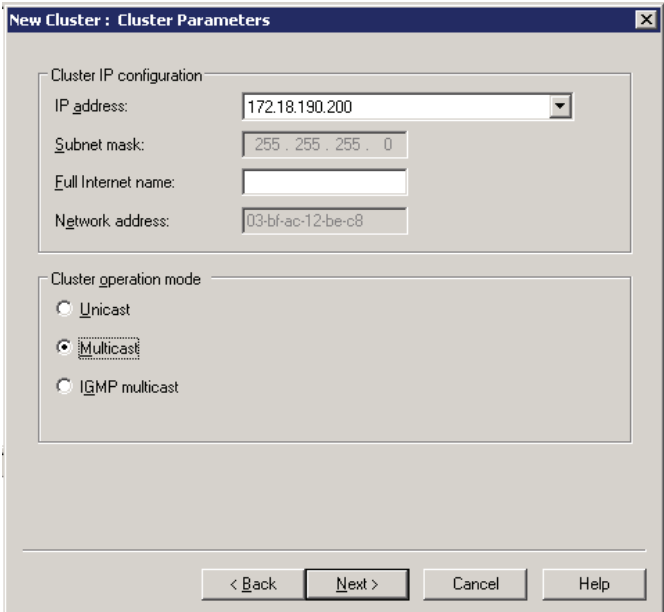

The "New Cluster: Cluster IP Addresses" dialog box is shown. It has a title bar with a close button. The text inside reads: "The cluster IP addresses are shared by every member of the cluster for load balancing. The first IP address listed is considered the primary cluster IP address and used for cluster heartbeats." Below this is a section titled "Cluster IP addresses:" containing a table with two columns: "IP address" and "Subnet mask". The table is empty. Below the table are three buttons: "Add...", "Edit...", and "Remove". At the bottom are four buttons: "< Back", "Next >", "Cancel", and "Help".

IP address	Subnet mask
------------	-------------

Set the Fully Qualified Domain Name (FQDN) name for the virtual cluster IP and choose Multicast as the cluster operation mode. Click Next to configure port rules.

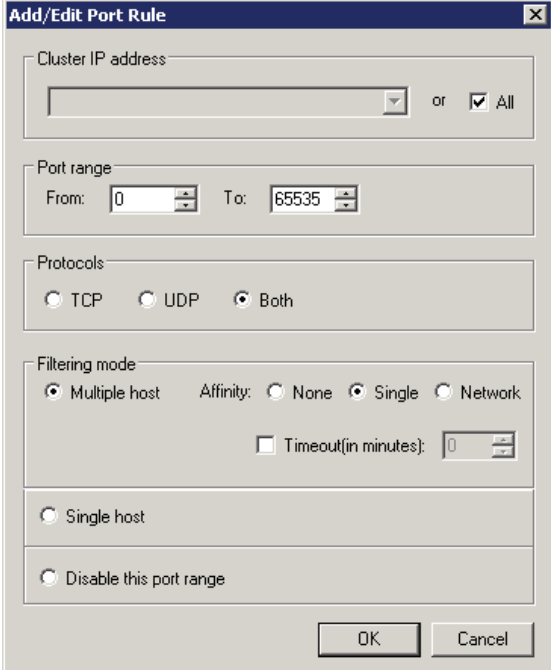

The "Add IP Address" dialog box contains three sections. The first section, "Add IPv4 address:", has radio buttons selected and contains two text boxes: "IPv4 address:" with the value "172 . 18 . 190 . 200" and "Subnet mask:" with the value "255 . 255 . 255 . 0". The second section, "Add IPv6 address:", has radio buttons unselected and contains a text box for "IPv6 address:". The third section, "Generate IPv6 addresses:", has radio buttons unselected and contains three checkboxes: "Link-local" (checked), "Site-local" (unchecked), and "Global" (unchecked). At the bottom right are "OK" and "Cancel" buttons.

The "New Cluster: Cluster Parameters" dialog box has two main sections. The "Cluster IP configuration" section contains four text boxes: "IP address:" with a dropdown menu showing "172.18.190.200", "Subnet mask:" with "255 . 255 . 255 . 0", "Full Internet name:" (empty), and "Network address:" with "03-bf-ac-12-be-c8". The "Cluster operation mode" section contains three radio buttons: "Unicast" (unselected), "Multicast" (selected), and "IGMP multicast" (unselected). At the bottom are "< Back", "Next >", "Cancel", and "Help" buttons.

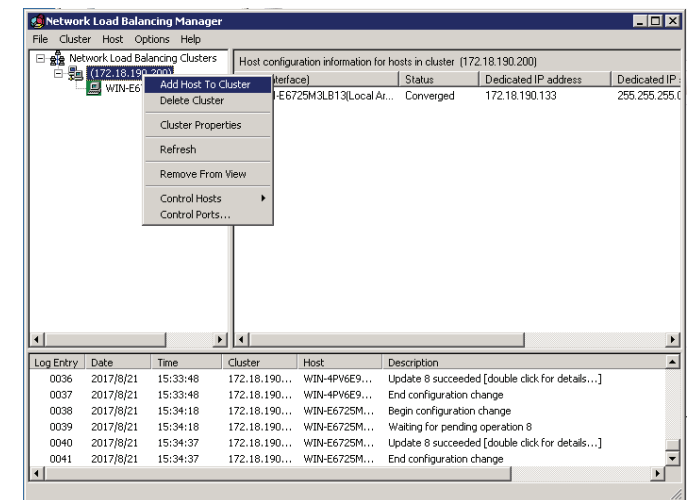

Click Add to add any port rules, and click Next to finish the node 1 cluster configuration.

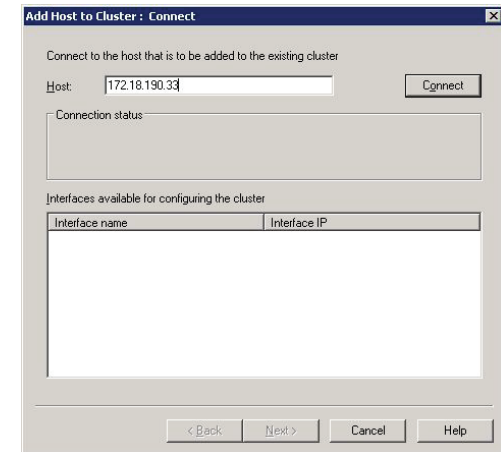

The "Add/Edit Port Rule" dialog box is shown. It contains the following fields and options:

- Cluster IP address:** A text box with a dropdown arrow, followed by "or" and a checked ☐ labeled "All".
- Port range:** "From:" with a value of 0 and "To:" with a value of 65535.
- Protocols:** Radio buttons for TCP, UDP, and Both (which is selected).
- Filtering mode:** Radio buttons for Multiple host (selected), Single host, and Disable this port range. Under Multiple host, there are radio buttons for Affinity: None, Single (selected), and Network. A checkbox for "Timeout(in minutes):" is set to 0.
- Buttons:** OK and Cancel at the bottom right.

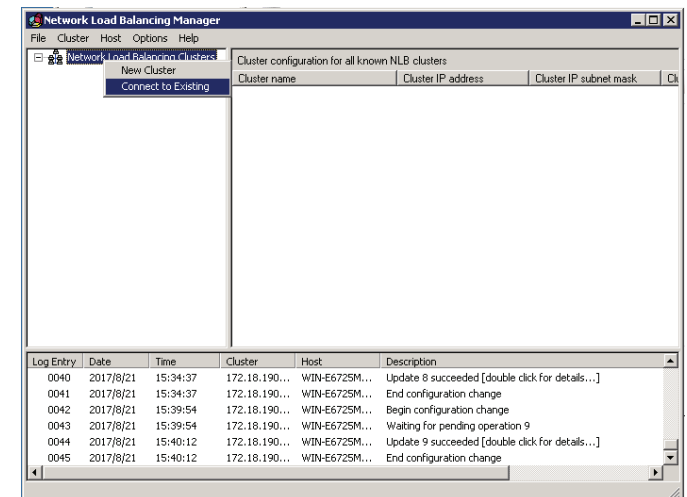

On the Network Load Balancing Manager screen, wait for the host state to change to Converged, and then right-click the cluster name and click "Add Host To Cluster".

Enter the IP address of node 2, and follow the instructions for node 1 to add the node to the cluster.

When complete, open the Network Load Balancing Manager on node 2 and right-click the Network Load Balancing Clusters entry in the pane on the left. Click "Connect to Existing" and enter the node 1 IP address. Click Connect and when the Connection status is "Connected", click Finish to finish adding node 2 to the cluster. After this, it should be possible to reach the cluster using the virtual IP addresses assigned earlier in the instructions.

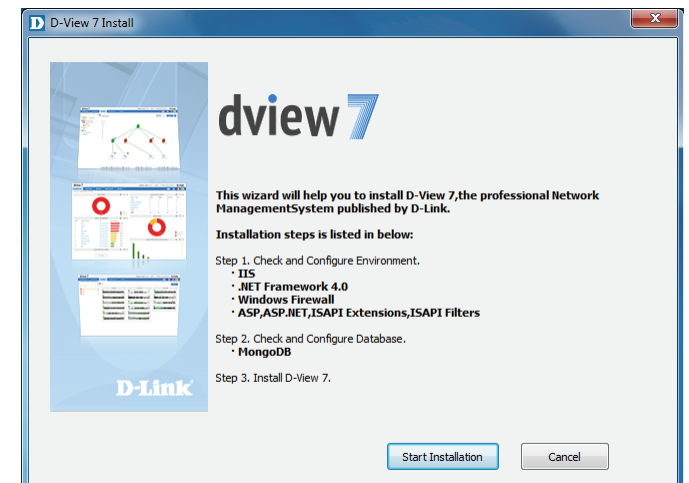

Install D-View 7

On node 1 in the D-View 7 cluster, run the D-View 7 installation package. Choose **Cluster Server** as the Core Server Type and choose **Master** as the Cluster Role. Click OK to continue.

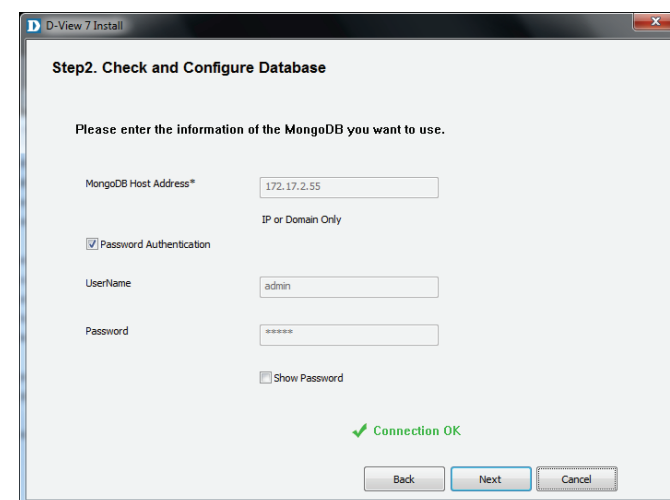

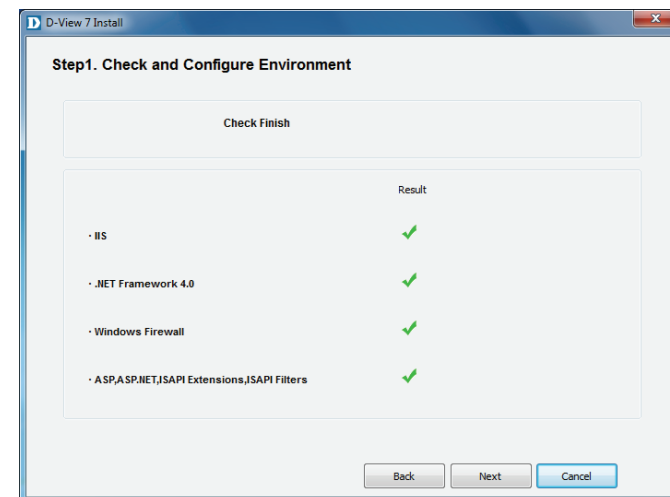

On the next page, ensure that the requirements are met and click Start Installation to check and configure the environment.

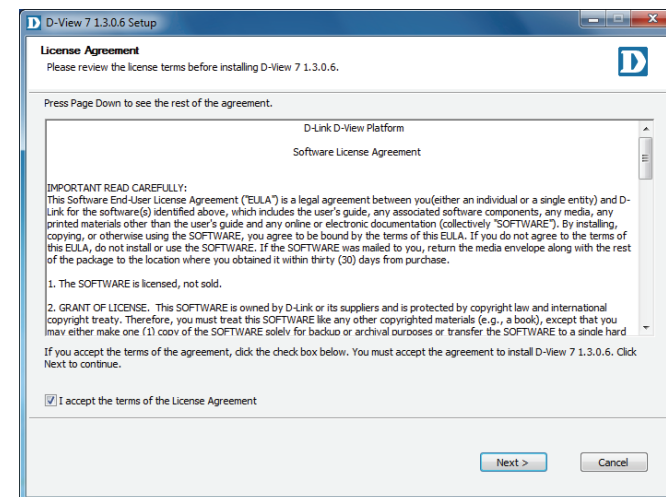

The installer will check the requirements have been met. If the result of all tests is successful, press Next to configure the database.

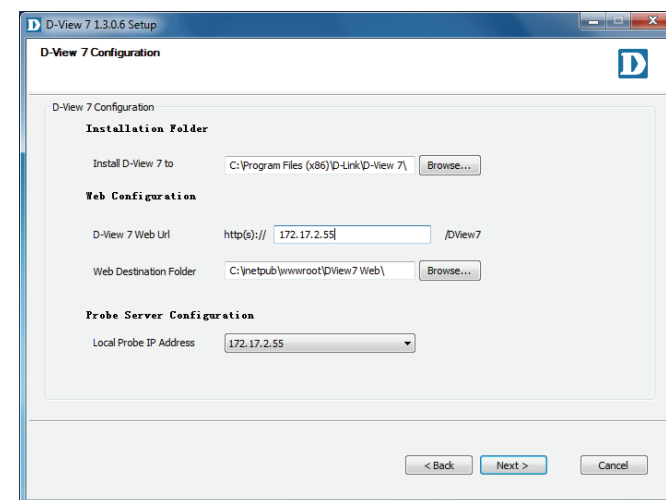

Enter the details of the MongoDB database set up earlier. The MongoDB Host Address is the IP address or domain name of the MongoDB host. Un-check the Password Authentication check-box, or if MongoDB was installed as part of a previous D-View 7 installation, enter the username of **"admin"** and password of **"admin"**. Click Check Connection to test the connection with the MongoDB server, and click Next to display the licence agreement.

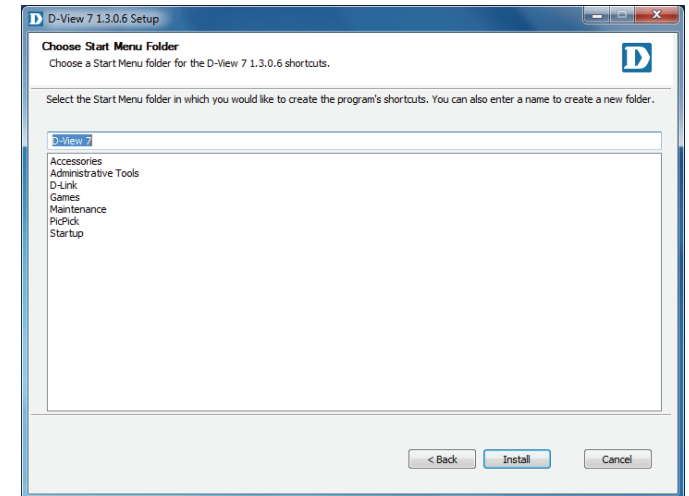

Click I accept the terms of the license Agreement if you accept the terms of the licence agreement, or press Cancel to exit the installer if you do not accept the terms. Press Next to configure the web URL and probe settings.

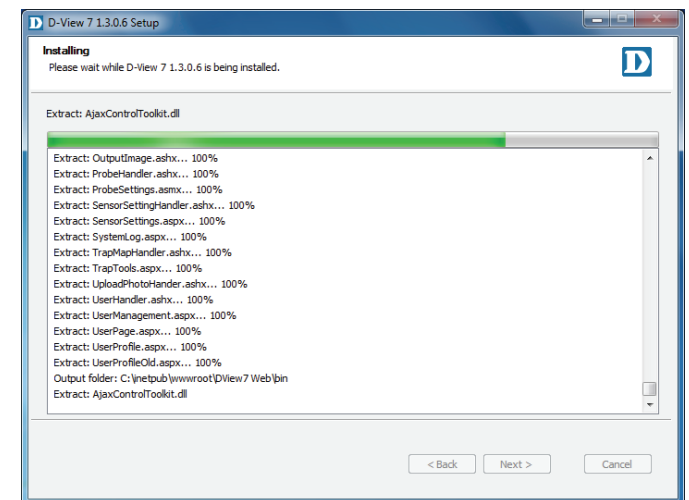

In the Installation Folder section, enter the path to install D-View 7 to, or click Browse... to select a location. In the Web Configuration section, enter the URL that will be used to access D-View 7, and choose the local folder where the web files will be stored. In the Probe Server Configuration section, choose the local probe IP address, and Press Next to choose a Start menu folder.

Enter the name of the Start menu folder, and press Install to install D-View 7.

When the installation is complete, press Next to view the confirmation page.

Press Finish to exit the installer.

On node 2 in the D-View 7 cluster, run the D-View 7 installation package, but choose **Cluster Server** as the Core Server Type and choose **Slave** as the Cluster Role. Follow the same instructions as node 1 to complete the installation.

Access the D-View 7 interface by accessing the following URL:

`http://<cluster IP>/DView7` (if not using SSL)

`https://<cluster IP>/DView7` (if using using SSL)

Replace <cluster IP> with the virtual cluster IP configured as part of the NLB settings above.

Upgrading From D-View 6 to 7

It is not possible to migrate the data from an existing D-View 6.0 installation to D-View 7 due to the new database technology introduced with D-View 7. D-View 7 uses a completely different design and architecture that allows network administrators to more easily manage end devices as well as streamline their workflow process.

If D-View 6 is currently installed on a network, a number of steps can be taken to ensure that deploying D-View 7 goes smoothly:

1. Install D-View 7 on a new server.
2. Collect the subnet information and SNMP communities from D-View 6.
3. Configure the discovery network and SNMP communities in the D-View 7 and start to discover the network.

Note: Do not install D-View 6 and D-View 7 on the same server! Doing so will cause database and network conflicts.

Changing from a Single to Multiple D-View 7 Servers

These instructions allow you to migrate from a single D-View 7 server with a single MongoDB server, to multiple D-View 7 servers and a single MongoDB server. D-View 7 is uninstalled from the original D-View 7 server, and MongoDB remains on this server. This becomes the MongoDB host that two new D-View 7 servers connect to for the database.

Before beginning with the instructions, please make sure that in addition to the original D-View 7 server that is being upgraded, you have at least two more hosts on the same subnet. Please make sure that all servers are able to reach each other using ICMP ping and that the Network Load Balancing (NLB) service is installed and active on the two servers which will become the new D-View 7 servers.

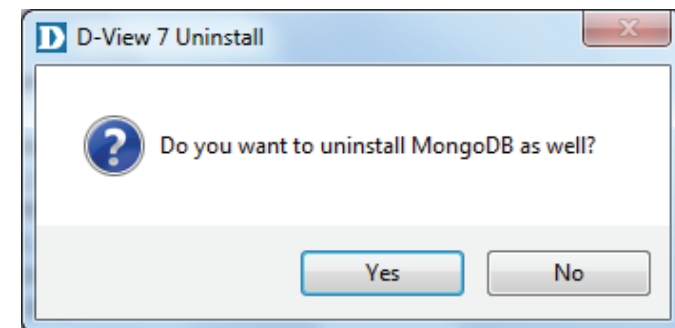

Uninstall D-View 7

Note: when performing the uninstallation process, you will be asked if you want to uninstall MongoDB as well. Be sure that you choose No for this step, as this is required for the D-View 7 cluster to function.

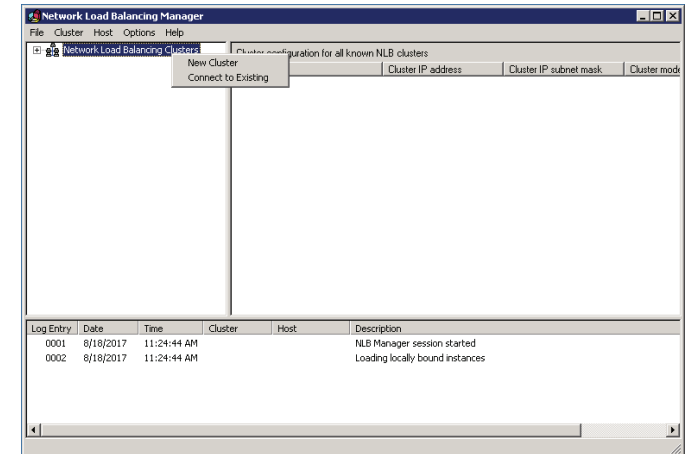

Note: before uninstalling the original D-View 7 Core server, make sure to unbind the license first.

To uninstall D-View 7, please see **Uninstallation** on page 63. When uninstallation is complete, please proceed with the instructions below.

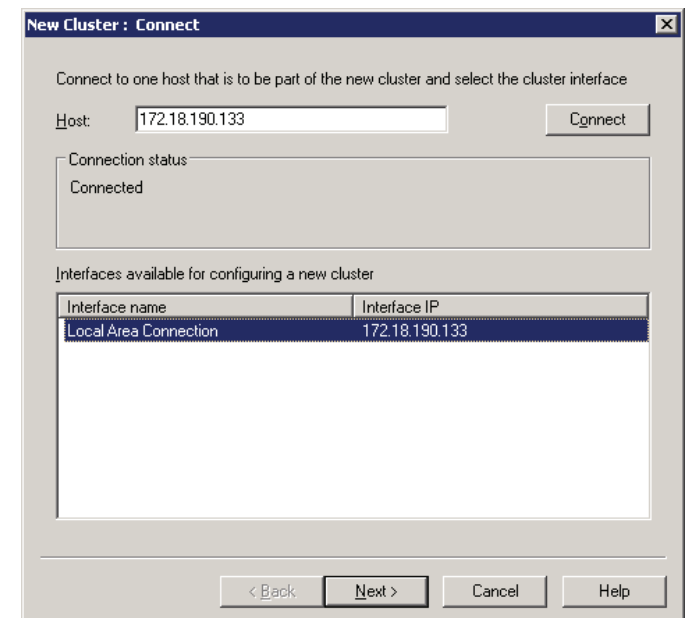

[Add License](#)[Deactivate License](#)[Unbind License](#)

Set up Load Balancing

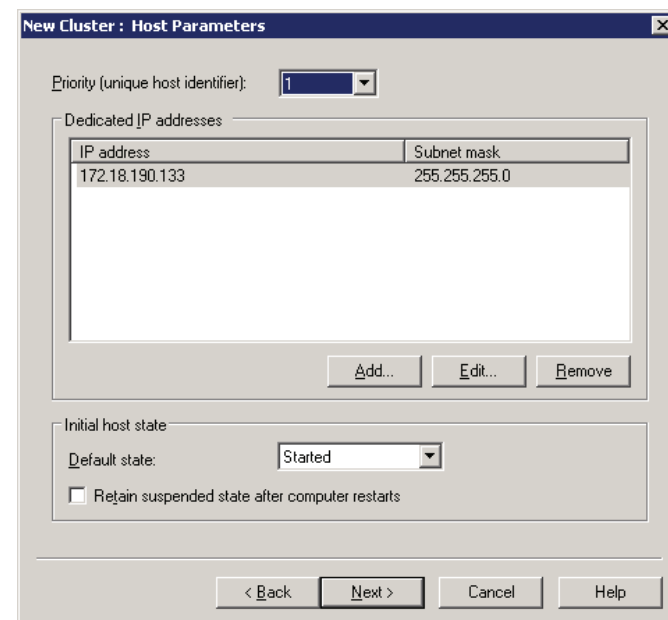

On node 1 in the D-View 7 cluster, open the Network Load Balancing Manager. Right Click "Network Load Balancing Cluster", and then click "New Cluster".

Input the node 1 IP address, and then click Connect. When the Connection status is "Connected", click Next to set the Host Parameters.

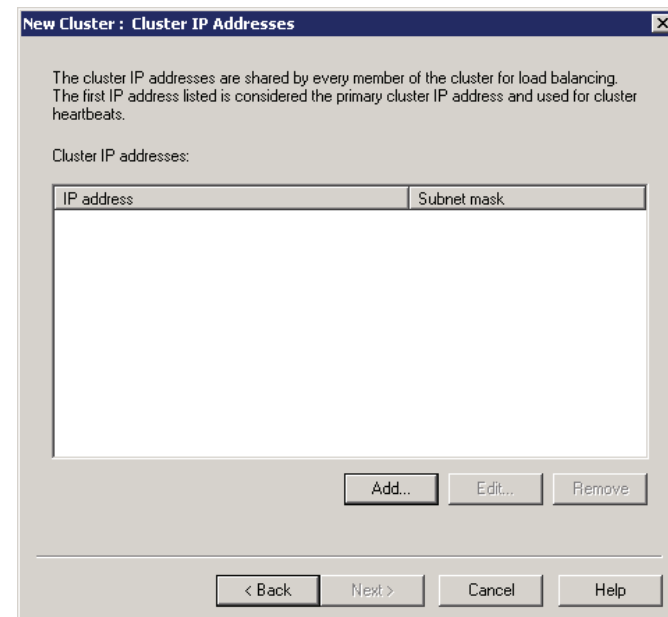

Set the priority of node 1. If the two D-View 7 servers are unequal in terms of performance, give the higher-powered server the lower priority. This will become the master server. Click Next to set the cluster IP addresses.

The "New Cluster: Host Parameters" dialog box is shown. It has a title bar with a close button. The "Priority (unique host identifier):" is set to 1. Below is a table for "Dedicated IP addresses" with one row: IP address 172.18.190.133 and Subnet mask 255.255.255.0. There are "Add...", "Edit...", and "Remove" buttons below the table. The "Initial host state" section has a "Default state:" dropdown set to "Started" and a checkbox "Retain suspended state after computer restarts" which is unchecked. At the bottom are "< Back", "Next >", "Cancel", and "Help" buttons.

IP address	Subnet mask
172.18.190.133	255.255.255.0

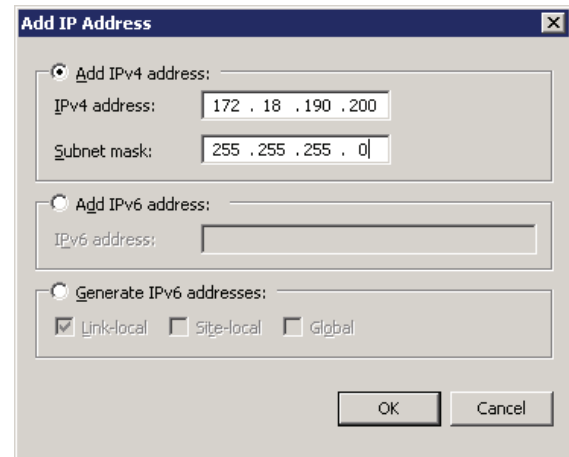

Click Add to add the virtual cluster IP address that the cluster will respond to. Ensure that this address is in the same subnet as the host addresses, and click next to set the Cluster parameters.

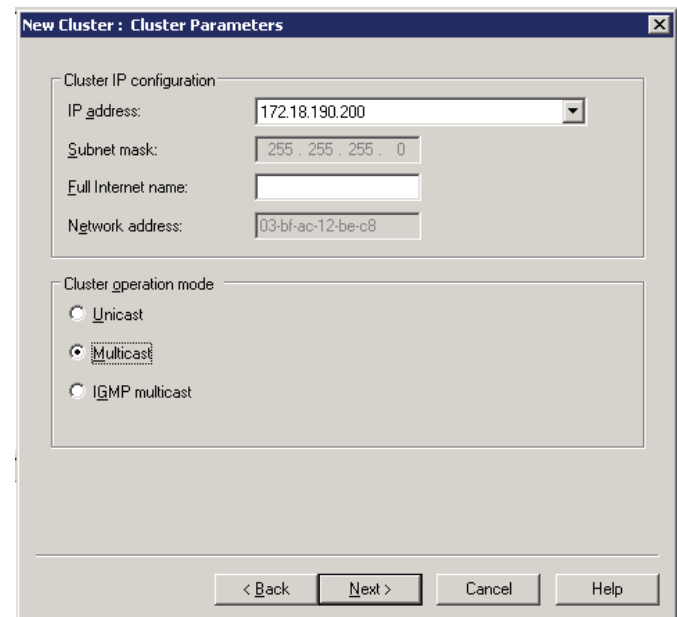

The "New Cluster: Cluster IP Addresses" dialog box is shown. It has a title bar with a close button. The text explains that cluster IP addresses are shared for load balancing and the first listed is the primary. Below is a table for "Cluster IP addresses:" with columns for "IP address" and "Subnet mask". There are "Add...", "Edit...", and "Remove" buttons below the table. At the bottom are "< Back", "Next >", "Cancel", and "Help" buttons.

IP address	Subnet mask
------------	-------------

Set the Fully Qualified Domain Name (FQDN) name for the virtual cluster IP and choose Multicast as the cluster operation mode. Click Next to configure port rules.

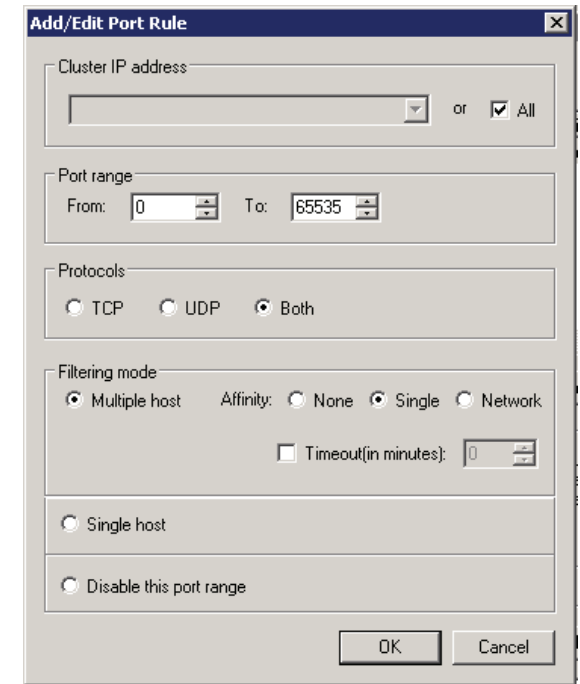

The "Add IP Address" dialog box contains three sections. The first section, "Add IPv4 address:", has radio buttons selected and contains two text boxes: "IPv4 address:" with the value "172 . 18 . 190 . 200" and "Subnet mask:" with the value "255 . 255 . 255 . 0". The second section, "Add IPv6 address:", has radio buttons unselected and contains a text box for "IPv6 address:". The third section, "Generate IPv6 addresses:", has radio buttons unselected and contains three checkboxes: "Link-local" (checked), "Site-local" (unchecked), and "Global" (unchecked). At the bottom right are "OK" and "Cancel" buttons.

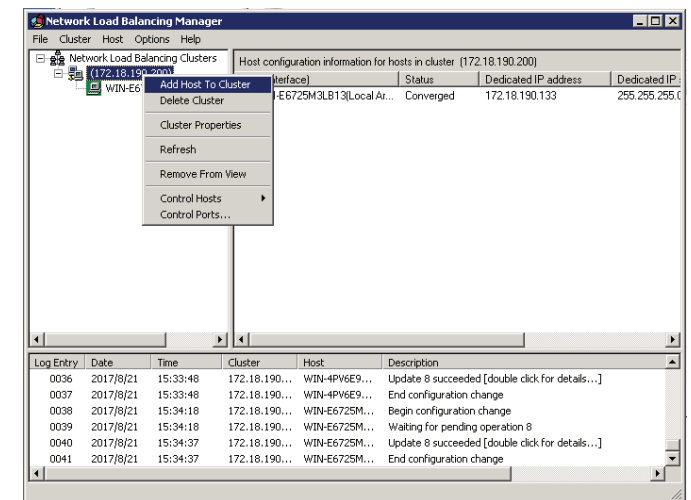

The "New Cluster : Cluster Parameters" dialog box contains two main sections. The first section, "Cluster IP configuration", contains four text boxes: "IP address:" with a dropdown menu showing "172.18.190.200", "Subnet mask:" with the value "255 . 255 . 255 . 0", "Full Internet name:" (empty), and "Network address:" with the value "03-bf-ac-12-be-c8". The second section, "Cluster operation mode", contains three radio buttons: "Unicast" (unselected), "Multicast" (selected), and "IGMP multicast" (unselected). At the bottom are "< Back", "Next >", "Cancel", and "Help" buttons.

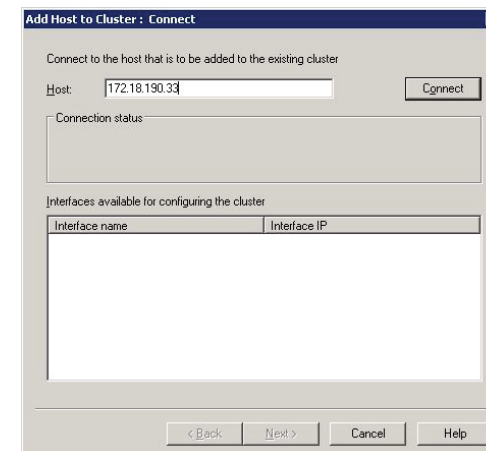

Click Add to add any port rules, and click Next to finish the node 1 cluster configuration.

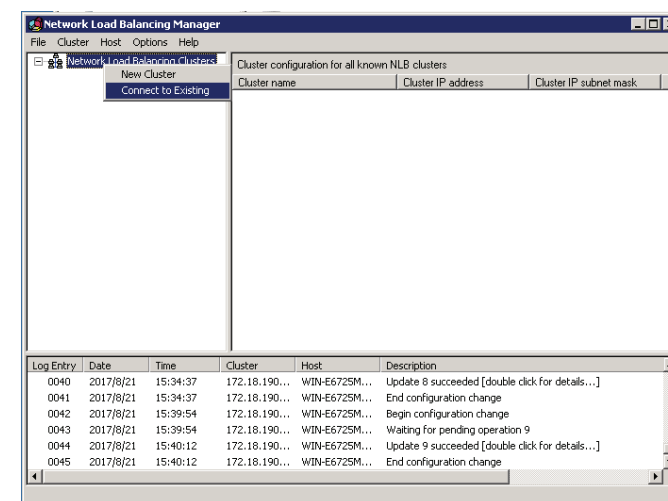

On the Network Load Balancing Manager screen, wait for the host state to change to Converged, and then right-click the cluster name and click "Add Host To Cluster".

Enter the IP address of node 2, and follow the instructions for node 1 to add the node to the cluster.

When complete, open the Network Load Balancing Manager on node 2 and right-click the Network Load Balancing Clusters entry in the pane on the left. Click "Connect to Existing" and enter the node 1 IP address. Click Connect and when the Connection status is "Connected", click Finish to finish adding node 2 to the cluster. After this, it should be possible to reach the cluster using the virtual IP addresses assigned earlier in the instructions.

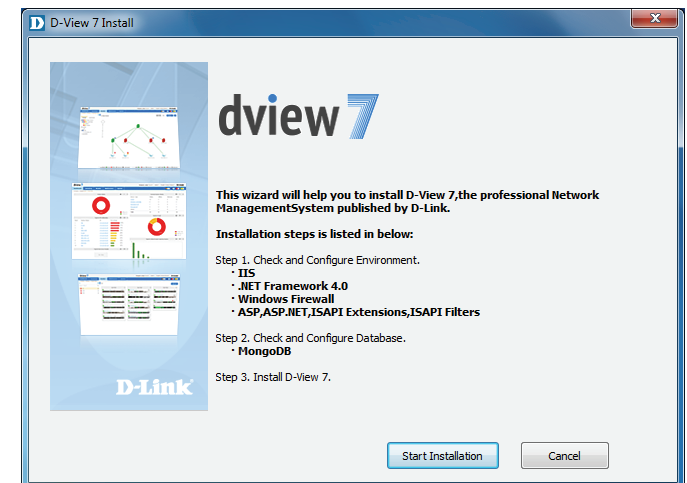

Install D-View 7

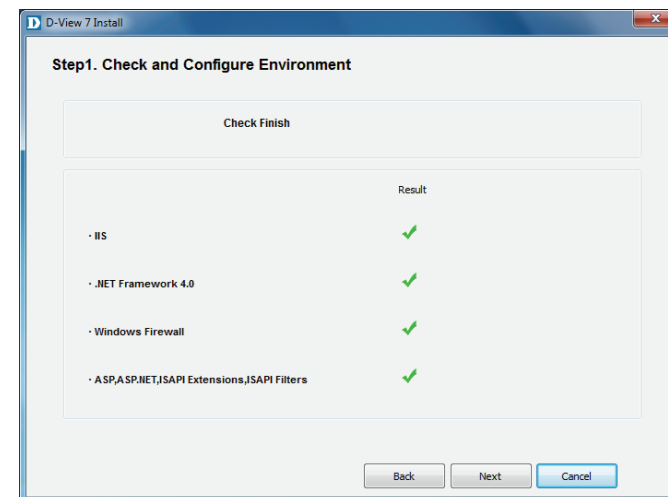

On node 1 in the D-View 7 cluster, run the D-View 7 installation package. Choose **Cluster Server** as the Core Server Type and choose **Master** as the Cluster Role. Click OK to continue.

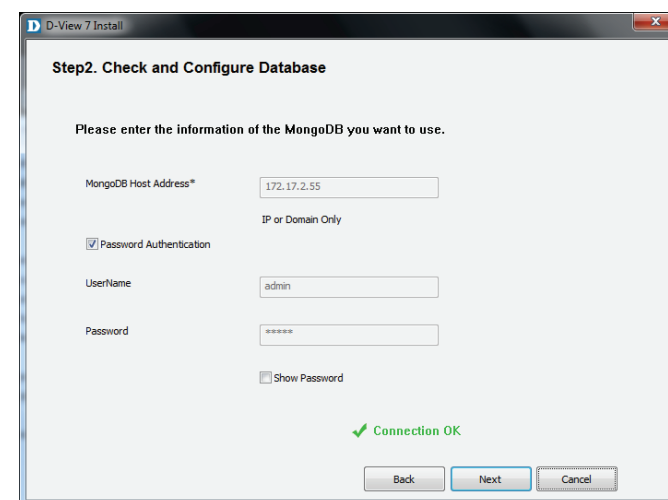

On the next page, ensure that the requirements are met and click Start Installation to check and configure the environment.

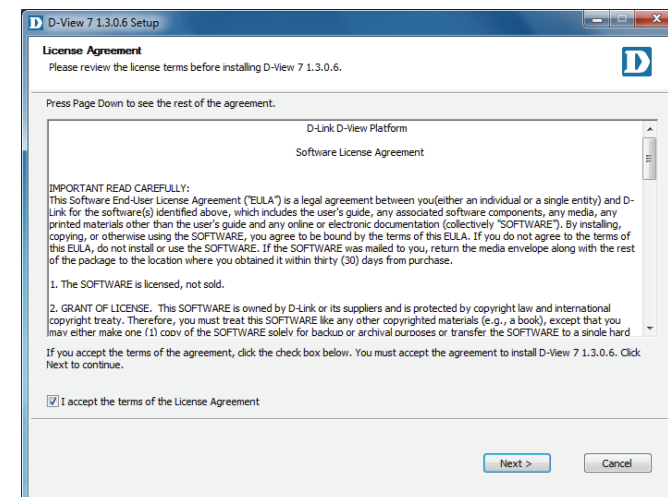

The installer will check the requirements have been met. If the result of all tests is successful, press Next to configure the database.

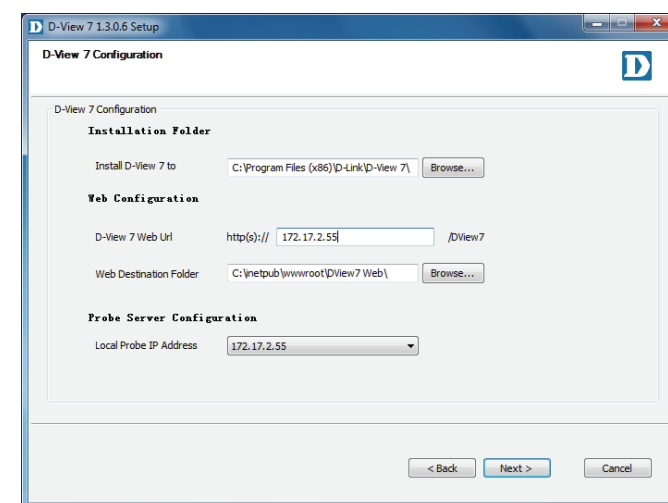

Enter the details of the MongoDB database set up earlier. The MongoDB Host Address is the IP address or domain name of the MongoDB host. Un-check the Password Authentication check-box, or if MongoDB was installed as part of a previous D-View 7 installation, enter the username of "**admin**" and password of "**admin**". Click Check Connection to test the connection with the MongoDB server, and click Next to display the licence agreement.

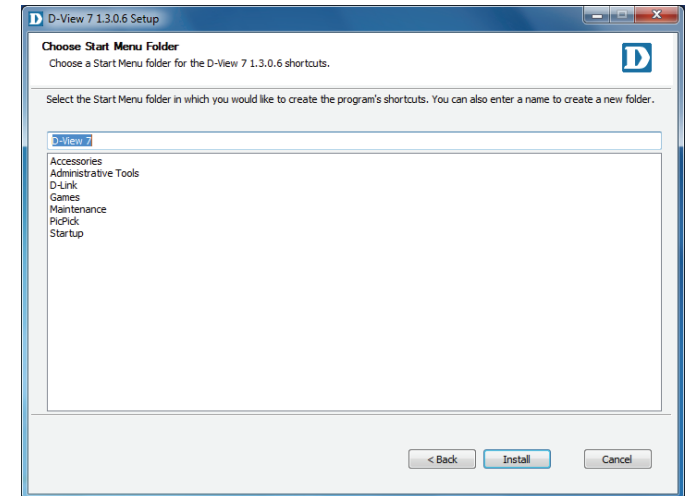

Click I accept the terms of the license Agreement if you accept the terms of the licence agreement, or press Cancel to exit the installer if you do not accept the terms. Press Next to configure the web URL and probe settings.

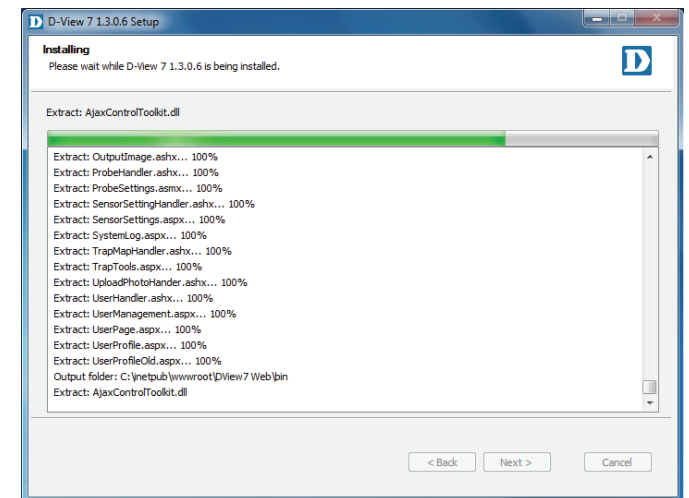

In the Installation Folder section, enter the path to install D-View 7 to, or click Browse... to select a location. In the Web Configuration section, enter the URL that will be used to access D-View 7, and choose the local folder where the web files will be stored. In the Probe Server Configuration section, choose the local probe IP address, and Press Next to choose a Start menu folder.

Enter the name of the Start menu folder, and press Install to install D-View 7.

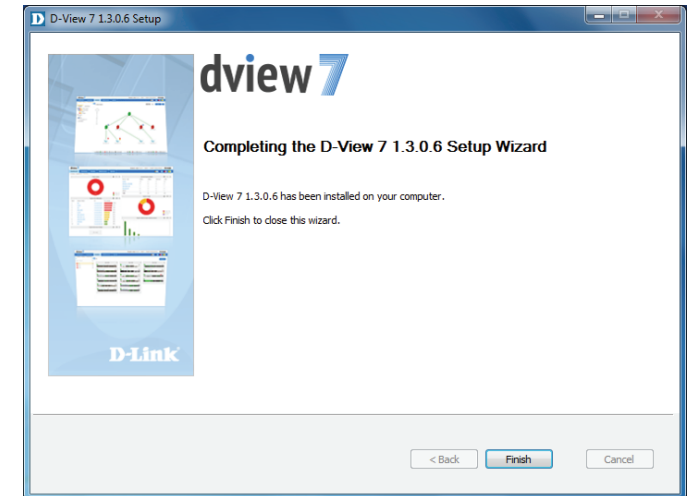

When the installation is complete, press Next to view the confirmation page.

Press Finish to exit the installer.

On node 2 in the D-View 7 cluster, run the D-View 7 installation package, but choose **Cluster Server** as the Core Server Type and choose **Slave** as the Cluster Role. Follow the same instructions as node 1 to complete the installation.

Access the D-View 7 interface by accessing the following URL:

<http://<cluster IP>/DView7> (if not using SSL)

<https://<cluster IP>/DView7> (if using using SSL)

Replace <cluster IP> with the virtual cluster IP configured as part of the NLB settings above.

Removing the Original D-View 7 Server IP From the Database

Open a command prompt on the MongoDB server by browsing to the Command Prompt entry in the Start menu.

Change to the MongoDB installation directory. In these instructions, this is "C:\Program Files\MongoDB\bin":

```
cd C:\Program Files\MongoDB\bin
```

Connect to the MongoDB database by running "mongo.exe". If you have any problems connecting, please make sure that the MongoDB service is started:

```
mongo.exe
```

Once you have logged in, switch to the admin database:

```
use admin
```

Enter "show users" to check the current database's users and check whether MongoDB is using authentication mode.

```
show users
```

If you get an "Error: not authorized message", enter the following to log-in as the admin user:

```
db.auth('admin','admin')
```

A result of "1" indicates that the command was successful.

```
C:\Users\Administrator>cd "C:\Program Files\MongoDB\bin"  
C:\Program Files\MongoDB\bin>
```

```
C:\Program Files\MongoDB\bin>mongo.exe  
2017-08-17T19:56:03.195+0800 I CONTROL [main] Notfix KB2731284 or later update  
is not installed, will zero-out data files  
MongoDB shell version: 3.2.6  
connecting to: test  
>
```

```
> use admin  
switched to db admin
```

```
> show users  
2017-08-24T10:16:27.067+0800 E QUERY [thread1] Error: not authorized on admin  
to execute command { usersInfo: 1.0 } :  
_getErrorWithCode@src/mongo/shell/utils.js:25:13  
DB.prototype.getUsers@src/mongo/shell/db.js:1523:1  
shellHelper.show@src/mongo/shell/utils.js:743:9  
shellHelper@src/mongo/shell/utils.js:650:15
```

```
> db.auth('admin','admin')  
1
```

Enter "use DView7" to switch to the DView7 database.

```
use DView7
```

In another command window, run "ipconfig /all" to get the MongoDB server's IP and MAC address:

```
ipconfig /all
```

Use the physical address in the output to remove the reference in the MongoDB database:

```
db.Cor_ClusterInfo.remove({CoreMAC:'AA:BB:CC:DD:EE:FF'})
```

```
> use DView7
switched to db DView7
```

```
C:\Users\Administrator>ipconfig /all

```

Activation

Activation of additional licenses can be completed either online or offline. The activation wizard can be started at any time by clicking on the **Upgrade** button located at the top of the D-View toolbar. Licenses can also be added from the License management page. To learn more about license management, please see **License** on page 96.

Clicking the **Upgrade** button will open the License activation wizard and will allow D-View to either be activated over the Internet, or activated using a license file that has been transferred from another system.

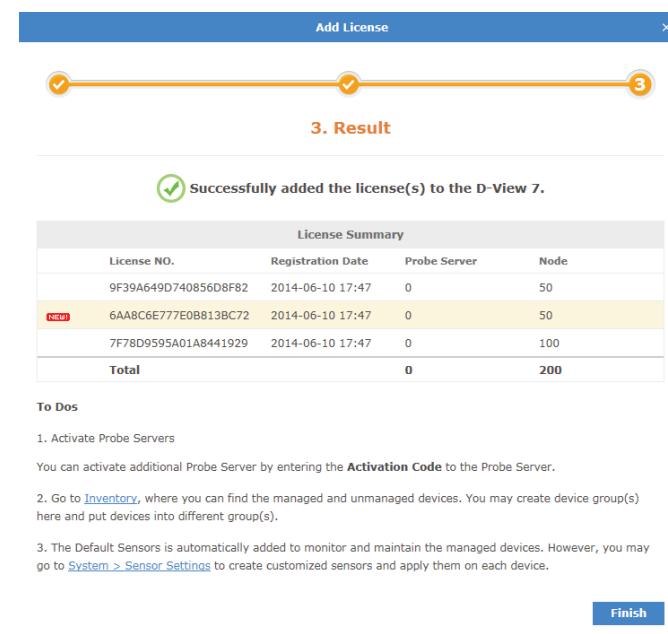

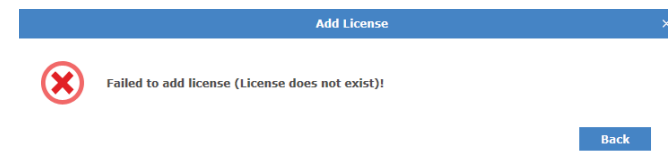

If activating over the Internet, enter the license key that was given with the purchased additional node or probe license pack. Multiple licenses can be activated at the same time by clicking on the "+" sign next to the license key field. The system will automatically recognize what type of license is being added and will verify it with D-Link's licensing servers. Once the license has been verified, the license key will be added to the license management page. To learn more about license management, please see **License** on page 96.

If offline activation is required, click **Browse** to navigate to the folder where the D-View 7 activation file is located. Click **Next** to continue.

The "Add License" dialog box shows a progress bar with three steps. Step 1, "1. Choose Activation Mode", is the active step. Below the progress bar, the text "Please choose the way you want to add licenses" is displayed. There are two radio button options: "Online Activation" (selected) and "Offline Activation". Each option has a brief description: "Use the License Key to activate your D-View 7 when the server is connected to the Internet." for Online, and "Use the Activation File to activate your D-View 7 when the server can not be connected with the Internet." for Offline. A "Next" button is located at the bottom right.The "Add License" dialog box shows the progress bar with Step 2, "2. Enter the License Key", as the active step. The text "Please enter the License Key" is shown above a text input field labeled "License Key". There is a small "+" icon to the right of the input field. "Back" and "Next" buttons are at the bottom right.The "Add License" dialog box shows the progress bar with Step 2, "2. Upload the Activation File", as the active step. The text "Please upload the Activation File" is shown above a text input field labeled "Activation File". There is a "Browse" button to the right of the input field. "Back" and "Next" buttons are at the bottom right.

If the license key entered or activation file used can not be verified with D-Link's activation servers, please check to ensure that the license key does not contain any invalid characters and that the MAC address of the system being used matches the MAC address that was used to register D-View.

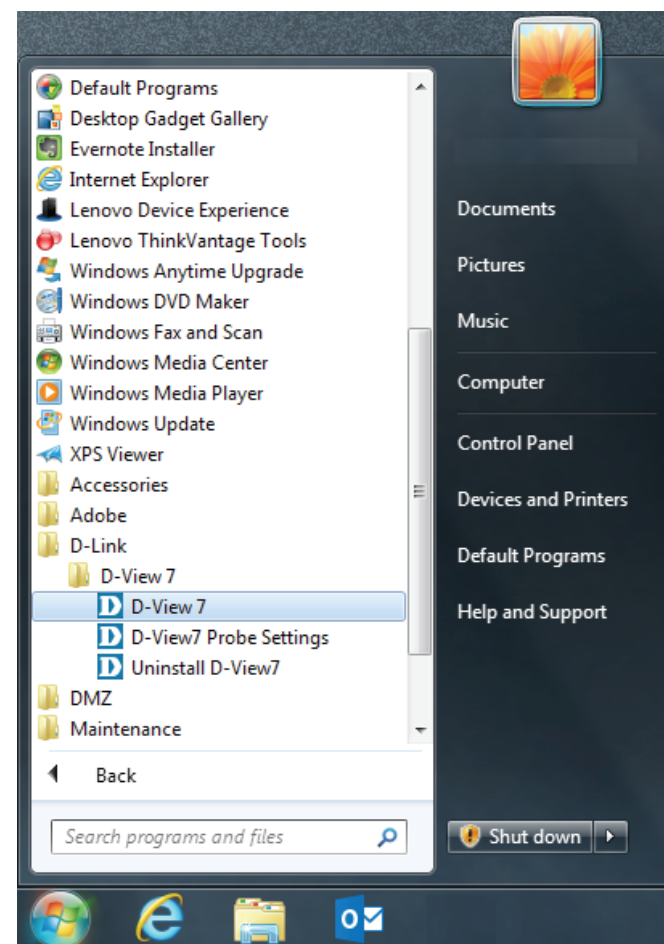

Once the license key or activation file has been verified, the D-View 7 server will automatically adjust the number of available nodes or probes, depending on the license type. Licenses can be managed by clicking on **System > License** from the D-View 7 tool bar. For more information about licenses, please see **License** on page 96.

Launching the D-View 7 Dashboard

To start the **D-View 7** dashboard click on **Start > All Programs > D-Link > D-View 7 > D-View 7**.

The default web browser will launch and present the login screen.

Logging into the D-View 7 Dashboard

To log into D-View 7 enter an email/username and password and then click **Login**.

The default login credentials for the administrator account are email: "admin" and password: "admin".

This password can be changed later from the **User Profile > Security** panel.

The image displays two screenshots of the D-View 7 login interface. Both screenshots show a blue header with the 'dview7' logo. Below the header, there is a language selection dropdown menu set to 'English'. The first screenshot shows empty input fields for 'Email' and 'Password'. The second screenshot shows the 'Email' field filled with 'admin' and the 'Password' field filled with masked dots. Below the input fields, there is a 'Remember me' checkbox which is checked in the second screenshot, and a 'Forgot password?' link. A blue 'Login' button is positioned below these options. At the bottom of each form, there is a copyright notice: '© 2014 D-Link Corporation'.

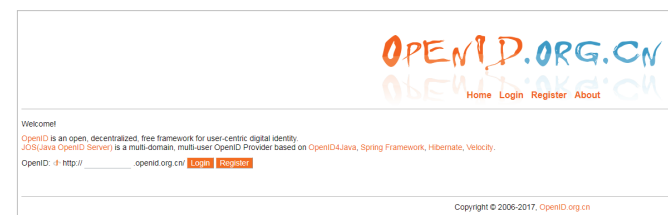

Logging into the D-View 7 Dashboard Using OpenID

Alternatively, D-View 7 can also be accessed using an OpenID. Refer to the instructions below on how to set up an OpenID account and configure D-View 7 to allow logging in using OpenID.

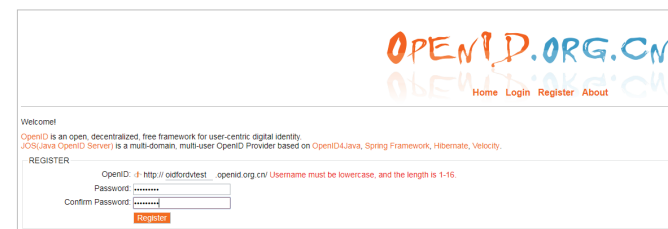

In order to use the OpenID service, an OpenID provider is necessary. In this example, we use OpenID.org.cn as the provider. The process should be the same for all OpenID providers.

Applying for an OpenID Account

Visit the website of the OpenID provider of your preference and apply for an OpenID account. Throughout this example, we will be using **http://openid.org.cn**.

Complete the required fields with the necessary information and click **Register** to complete the registration process. Please note that the user name cannot contain numbers.

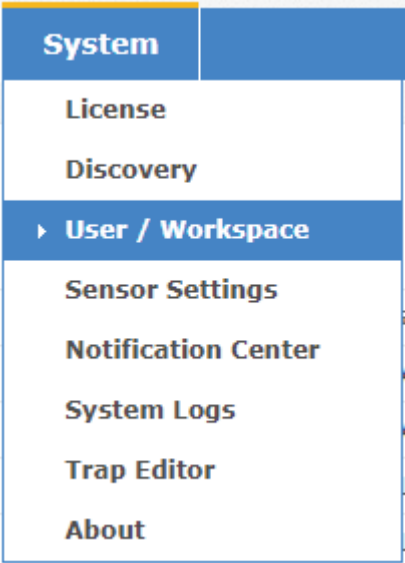

If everything was entered correctly, a message will appear confirming the registration was successful.

Configuring D-View 7 to Work With OpenID

Note: We recommend configuring the SMTP Server settings first before continuing. Refer to the **System -> About** page for more information on how to configure SMTP settings.

In the D-View 7 interface, navigate to the **System > User / Workspace** page and click **OpenID Provider** to configure the OpenID user information.

All Users Total Users 29 (2 27 0 0)

New User **OpenID Provider**

In the OpenID Provider window, complete the required fields and click **OK**. Refer to the descriptions below for more information on each field.

- Provider name:** The name of the provider that is providing the OpenID service. In this example, the provider name is **OpenID.org.cn**.
- URL:** The OpenID URL that was registered with the OpenID provider. In this example, this is the URL registered with openid.org.cn.
- Abbreviation:** This is the abbreviated name for the OpenID account.

OpenID Provider ×

Provider Name*

OpenID.org.cn

OK

Count: 3 / 10

Name	URL	Abb.	User	Action
openid	http://longvuwewang.openid.org.cn/	WLY	0	
DV7_TEST OpenID	http://dvopenid.openid.org.cn/	TEST	1	

Save

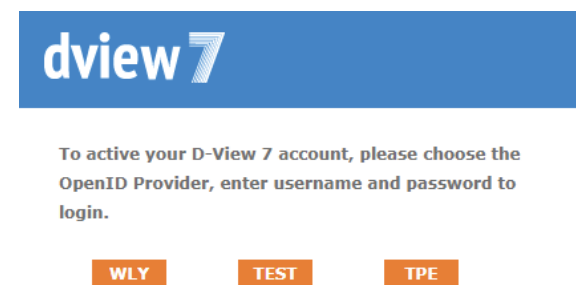

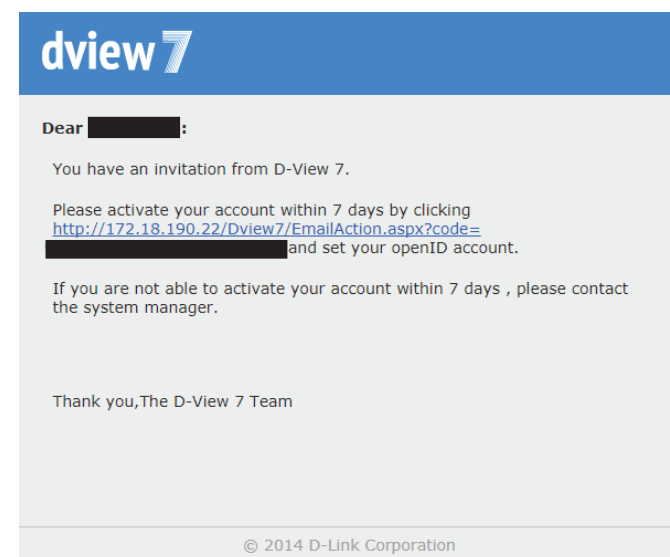

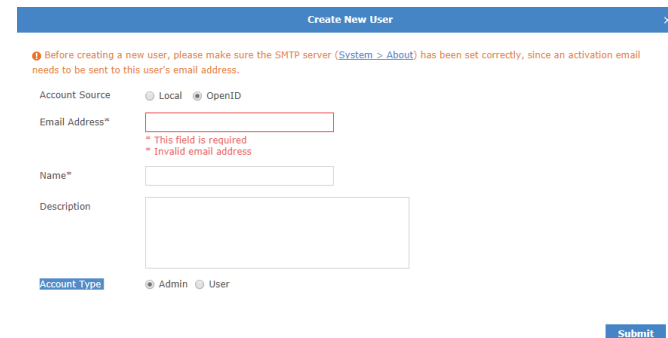

Next, click **New User**. In this Create New User window, choose **OpenID** as the Account Source and enter a valid email address and name. An email will be sent to this address containing a hyperlink to active your OpenID account.

The email address and name fields are required.

When you receive the activation letter in your inbox, open it and click the hyperlink to active your OpenID account.

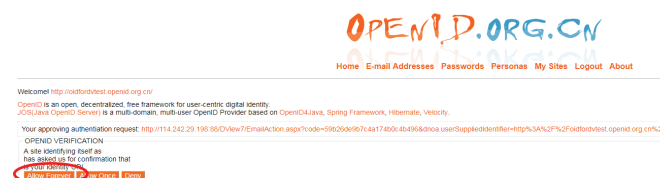

Note that you must activate your account within 7 days of receiving the letters.

Clicking the link in the invitation letter will bring you the account activation window. Click the abbreviation of your OpenID account, in this example **TPE**. This will refer you to the OpenID account activation page.

On the OpenID login page, enter your registered OpenID login and password click **Login**. After successfully logging in, click **Allow Forever**. You will receive a confirmation window that your OpenID was successfully activated.

Click **Go to Login** to return to the D-View 7 login page.

Your account has been activated successfully

[Go to Login](#)

D-View 7 is now configured to allow logging in using your OpenID account.

A screenshot of the D-View 7 login page. The header is a blue bar with the 'dview7' logo. Below the header is a language dropdown menu set to 'English'. There are two input fields: 'Email' with a user icon on the right, and 'Password' with a lock icon on the right. Below these fields is a 'Remember me' checkbox and a 'Forgot password?' link. A large blue 'Login' button is centered below the form. At the bottom, there is a section titled 'Login with OpenID Account' with three orange buttons: 'WLY', 'TEST', and 'TPE'.

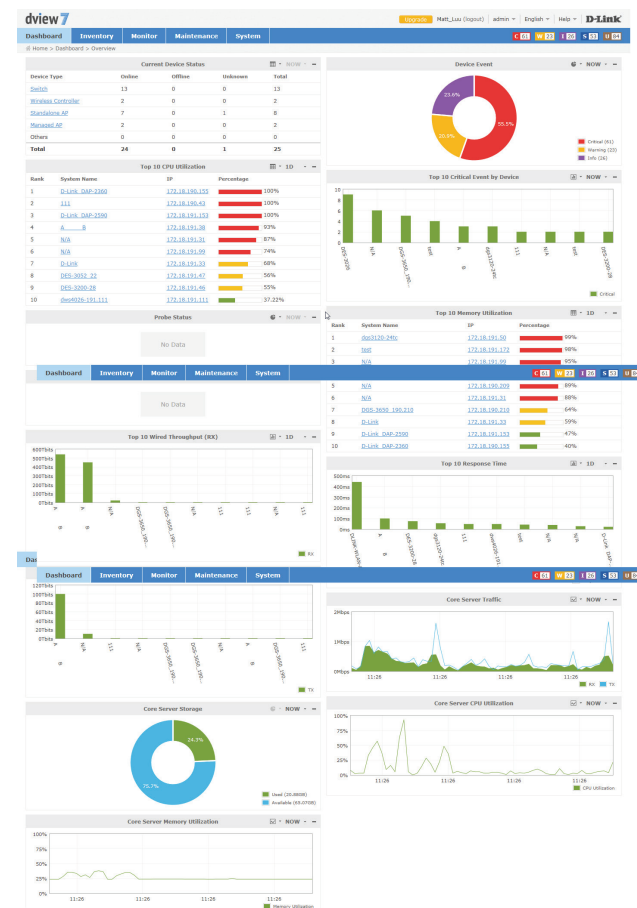

Dashboard

D-View's dashboard interface provides easy access to all views and tools from a single location. The dashboard is made up of a number of different widgets that can be created and rearranged based on the current users preferences.

By default, D-View will open the Overview dashboard. This dashboard contains a basic set of metrics that would be helpful to a network administrator. The widgets contained within the Overview dashboard can be rearranged by clicking and dragging a widget title bar.

D-View also has a Wireless dashboard, which contains widgets that are specific to the wireless capable devices that are present on the D-View managed network.

For more details on how to use and manage the Overview and Wireless dashboard, please see **Dashboard Interface** on page 60.

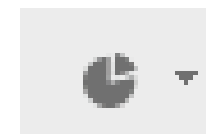

Dashboard Interface

Each widget in the Overview and Wireless dashboard has three available options to help customize the displayed data by either changing the widget style, changing the time period for the data being displayed, or to completely minimize the widget from view.

To change the widget display type, click on the drop down option. This will allow the widget to switch between a visual graph mode, or a grid/table view that displays data only.

To change the time period for the data that is currently displayed, click on the drop down menu and select the time period desired. If the time period option is greyed out, the widget is only able to display the most current available data.

To hide the widget from view, click on the "-" sign. To expand the widget and show its data again, click on the "+" sign. At any point the widgets may be rearranged by clicking and dragging the title bar into the desired order.

Customized Dashboard

D-View allows for the creation of customized dashboards that contain a variety of different metrics. Dashboards are unique to the current workspace, so if more than one user shares a workspace, the newly created dashboard will be shared among the users. If it is necessary to separate dashboards between different users, the users must be in different workspaces. To find out more about setting up workspaces, please see **User Management** on page 99.

To begin creating a customized dashboard, hover over the **Dashboard** menu item, and click on **Customized**

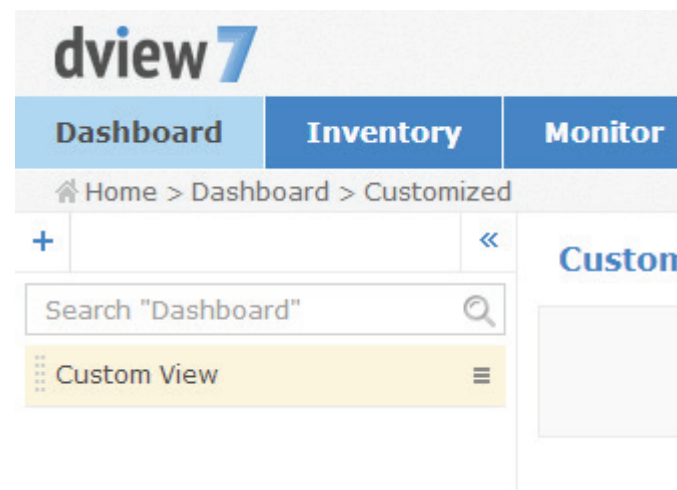

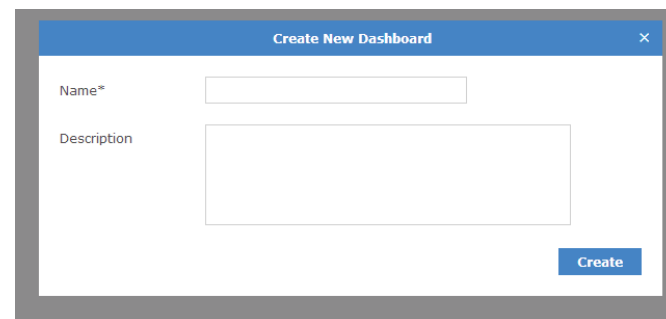

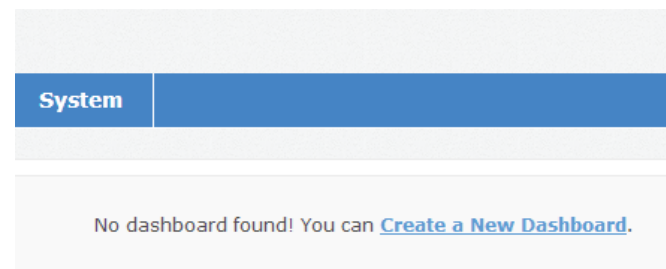

If D-View has just been installed, or if this is a new workspace, the customized dashboard list will be empty. Click on the **Create a New Dashboard** link to start creating a new dashboard.

When the **Create New Dashboard** dialogue box opens, enter a unique name for the dashboard. An optional description for the dashboard may also be entered to help identify it. Click **Create** to save the dashboard to the current workspace.

The newly created dashboard will appear in a column list on the left side of the browser. To add another customized dashboard, click on the "+" sign at the top of the dashboard list. To hide the dashboard list from view, click the "<<" sign at the top of the dashboard list. Dashboards may also be filtered by entering a part or the whole name of the dashboard into the search box.

The dashboard list can be reordered by clicking the left part of the dashboard name, and dragging the selected item either up or down in the list.

To rename or delete a dashboard, click on the drop down menu item located on the right part of the dashboard name.

Customized Dashboard Widgets

If this is a new dashboard, click on the **Add a New Widget** link to begin adding a new widget. If the dashboard has no widget, click the **Add a New Widget** link to create a new widget. If there is an existing widget, click on the **Add Widget** button located in the upper right of the Customized View to access the widget.

When the **Create New Widget** dialogue box opens, enter a unique name for the widget, and select the device that will provide the sensor data for the widget. The available types of sensors will change depending on the type of device that is selected. Some sensor options have additional options that must be specified before the widget can successfully be created. By default, the interval for the time period is set to 1 minute. Click **Create** to save the widget to the dashboard.

Once the widget has been saved, it will appear in the **Custom View** area. To rename a widget, click on the name in the widgets title bar.

To change the widget display type, click on the drop down option. This will allow the widget to switch between a visual graph mode, or a grid/table view that displays data only.

To change the time period for the data that is currently displayed, click on the drop down menu and select the time period desired. If the time period option is greyed out, the widget is only able to display the most current available data.

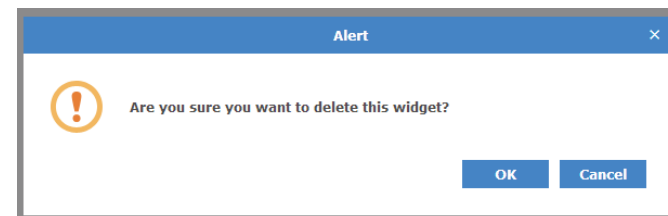

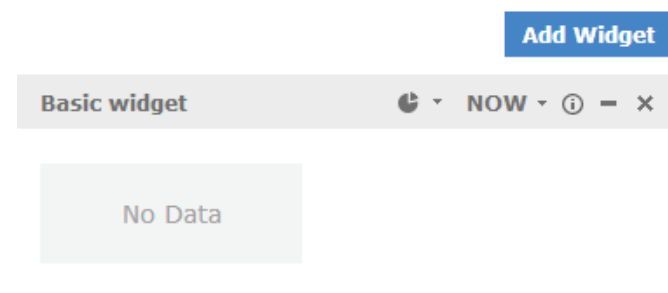

To display information about the device that the widget is associated with, hover over the information icon.

To hide the widget from view, click on the "-" sign. To expand the widget and show its data again, click on the "+" sign. At any point the widgets may be rearranged by clicking and dragging the title bar into the desired order.

To delete the widget, click on the X icon. A confirmation dialogue box will open to confirm the widget deletion.

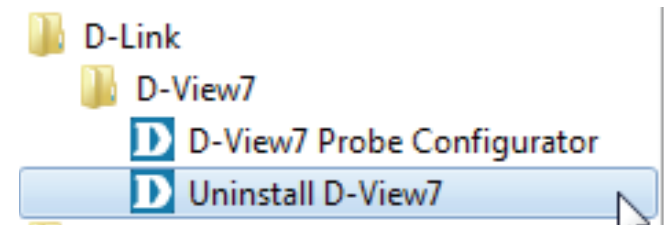

No widget found! You can [Add a New Widget](#) for this dashboard.

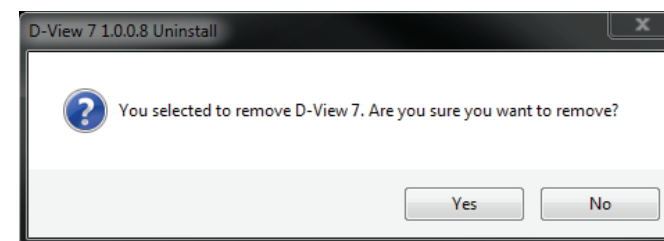

A dialog box titled "Create New Widget" with a close button (X). It contains two fields: "Name*" with a text input and "Choose a device*" with a dropdown menu showing "Choose one Item". A "Create" button is at the bottom right.

Uninstallation

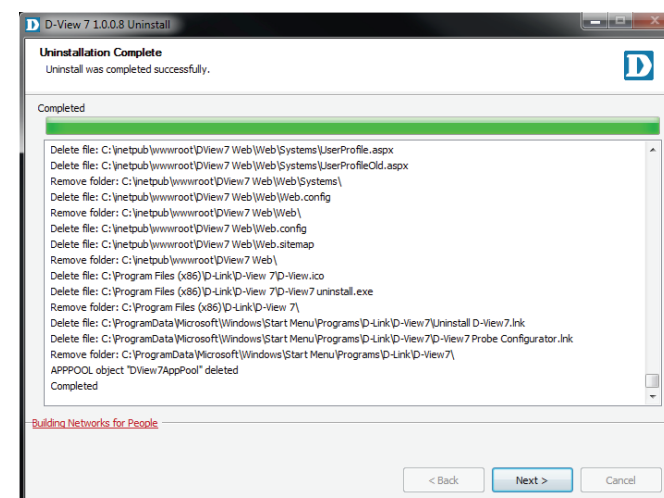

To uninstall the D-View 7 server, start the **Uninstall D-View7** application by clicking on **Start > D-Link > D-View7 > Uninstall D-View7** from the Windows Start menu.

A pop-up prompt will confirm that D-View 7 will be removed from the system. Click **Yes** to continue or **No** to cancel.

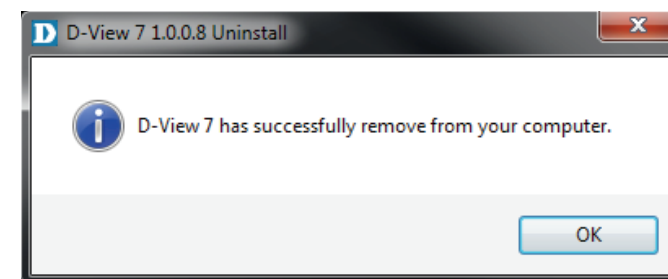

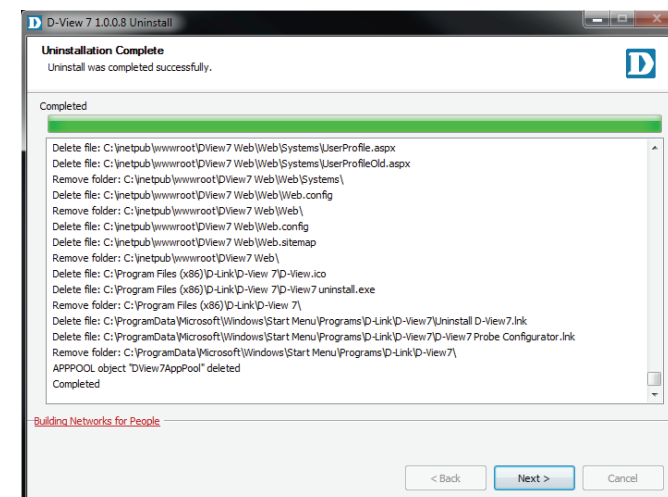

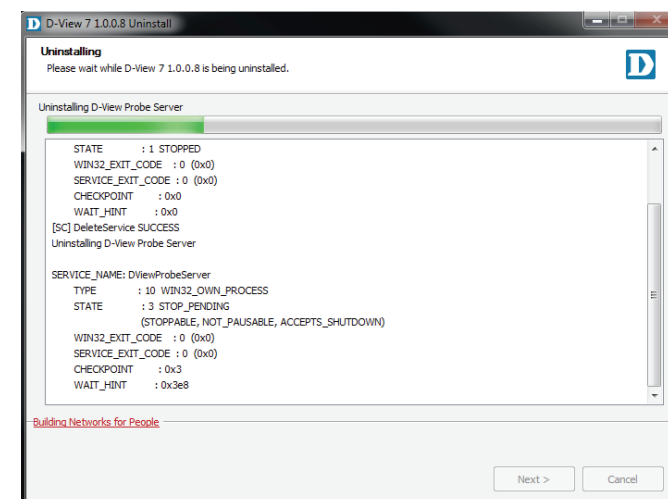

The progress indicator will display how much time is left until the uninstallation process for the D-View 7 service is complete. Depending on the speed of the system, the uninstallation can take several minutes to complete the process. Click **Next** to continue.

The D-View 7 probe service will also be uninstalled. The progress indicator will display how much time is left until the uninstallation process for the probe service is complete. Depending on the speed of the system, the uninstallation can take several minutes to complete the process.

When the uninstallation is complete, click **Next** to continue.

The D-View 7 application has been successfully removed. Click **OK** to complete the uninstallation process.

Inventory

The Inventory list shows hardware devices that are on the network and their relevant information such as IP address, Serial Numbers, and Firmware. The inventory list is separated into two major sections, managed and unmanaged. By default, the Inventory list will open the D-View Managed devices panel view. The managed device list can be further organized by applying labels to groups of devices. When a new device is added to the network, D-View will automatically add it to the unmanaged device list if it is discoverable. Devices that are in the managed list will be moved to the unmanaged list if they have been deleted from a specifically labelled group.

To create a new label click on the "+" sign in the upper left corner of the device list column. A popup window will open; enter a unique label name, assign a color to the label, and add a description to describe the label. Click **Create** to save the label to the device list. Labels are unique to the workspace that the user is currently in, and users in the same workspace will share labels.

The newly created inventory label will appear in a column list on the left side of the browser. To add another inventory label, click on the "+" sign at the top of the inventory label list. To hide the inventory label list from view, click the "<<" sign at the top of the inventory label list. Inventory labels may also be filtered by entering a part or the whole name of the inventory label into the search box.

The inventory label list can be reordered by clicking the left part of the label name, and dragging the selected item either up or down in the list.

To rename or delete an inventory label, click on the drop down menu item located on the right part of the inventory label name.

To add a device to a newly created inventory label, click on the **D-View Managed** link at the top of the inventory label list. In the **D-View Managed** panel, use the checkbox to select which devices to apply a label to and then click the **Label** drop down menu item to select the appropriate labels. Click **Apply** to save the selected label to the chosen devices.

Unmanaged

By default, newly discovered devices will appear in the **Unmanaged** device panel view.

To move devices from unmanaged to the managed device panel view, use the checkbox to select which devices to move, then click **Move to Managed**. To completely remove a device from D-View management, click on the **Delete Device** button.

Note: This will permanently remove the device and cannot be undone.

To export a list of all of the devices currently in the Unmanaged device panel view, click on **Export** to download a CSV file that can be imported into a spreadsheet application.

Devices may also be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box. Select a field to filter the results by, or use the advanced search to filter devices using multiple criteria.

Select the system name to view detailed information about the device. The device information page shows hardware information, device availability, SNMP information, system information, port usage, recent events and system statistics, such as device uptime and CPU utilization. The device can also be rebooted using the **Reboot** button.

Managed

Devices that are in the Managed device panel view can be directly managed by selecting either the System Name, or IP Address of the device. The number of devices that are currently in the Managed devices list, as well as the number of online, and offline devices is displayed in both the Inventory List column, as well in the device panel view.

To move devices between managed and unmanaged, use the checkbox to select which devices to move, then click **Move to Unmanaged**. To add a device to an inventory label, use the checkbox to select which devices to apply a label to and then click the **Label** drop down menu item to select the appropriate labels. Click **Apply** to save the selected label to the chosen devices.

To export a list of all of the devices currently in the Managed device panel view, click on **Export** to download a CSV file that can be imported into a spreadsheet application.

Devices may also be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

To reorder the current device panel view, click on the column title to sort by either ascending or descending.

To manage a device, click on its corresponding **System Name**, or **IP Address** link.

Device Detail Overview

The device detail overview gives a more complete dashboard view of a device. The default overview tab displays basic information that allows network administrators to get the information they need as quickly as possible.

The number and type of widgets, as well as available tabs displayed will depend on the type of devices.

Certain functions will also be available, such as the ability to Reboot a device, or configure additional settings.

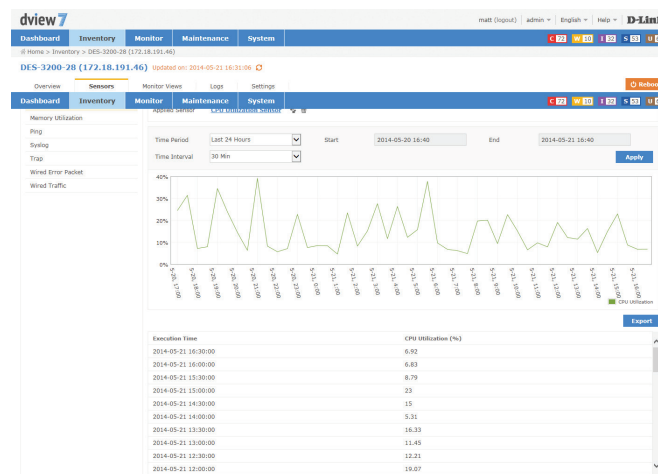

By default widgets are not able to be edited, and will only display information that has been manual entered. To edit information for a widget click on the **Edit** icon. This will allow the user to add information to any of the editable fields for that widget.

Device Detail Sensors

Every class of device has its own default sensors that can be accessed from the device detail sensors tab. For example, wireless access points will have sensors for different types of metrics that relate to wireless clients, wireless traffic, or ping time. While routers and switches will have sensors that show metrics such as CPU utilization, wire speeds, and wired error packets.

Customized sensors can be setup and applied to any device that is in the D-View Managed inventory list. For more information on how to create new sensors, please refer to **Sensor Settings on page 101**.

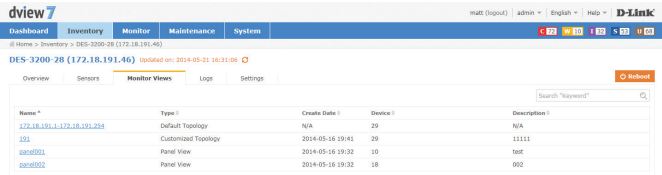

Device Details Monitor Views

The monitor views tab displays a list of all the topologies that the currently selected device is a part of. Clicking on the name link to a topology will open a new window with the topology view that includes the currently selected device.

Topologies may also be filtered by name by entering a keyword into the search box.

The monitor view displays the name of the topology, the type of topology it is a part of, the date the topology was created, the number of devices that are associated with the topology, and if available a description of the topology.

Device Details Settings

The **Device Details Settings** tab is available for devices that are able to receive configuration commands from the D-View 7 server. This will include classes of device such as managed switches, managed access points, and routers/firewall devices. Some of the options for the settings tab may change depending on the device.

Options for APs

SNTP / NTP Status: This option shows wether or not the device currently selected is configured to send status updates for NTP. To configure this option, use the management software for the device.

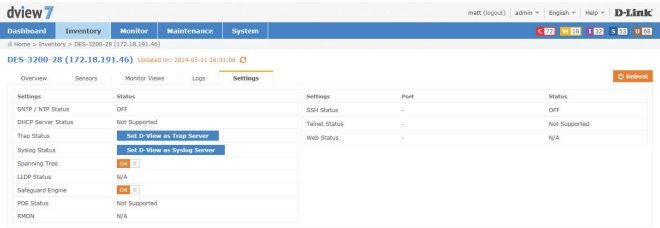

DHCP Server Status: This option shows wether or not the device currently selected is configured to send status updates for DHCP. To configure this option, use the management software for the device.

Trap Status: If the currently selected device is able to send Trap status to D-View and is not currently configured to do so, D-View 7 can attempt to configure the device. To do so, click on the **"Set D-View as Trap Server"** button. D-View 7 will attempt to make the necessary changes on the currently selected device and if successful, will change the interface to show that the option has been toggled on.

Syslog Status: If the currently selected device is able to send Syslog status to D-View and is not currently configured to do so, D-View 7 can attempt to configure the device. To do so, click on the **"Set D-View as Syslog Server"** button. D-View 7 will attempt to make the necessary changes on the currently selected device and if successful, will change the interface to show that the option has been toggled on.

Operation Mode: This shows the current operating state of the device. To configure this option, use the management software for the device.

SSH Status:

SNTP / NTP Status OFF

DHCP Server Status Not Supported

Trap Status Set D-View as Trap Server

Syslog Status Set D-View as Syslog Server

Operation Mode Access Point

If the currently selected device supports remote SSH log in, the SSH service for the device can be controlled by D-View 7. Use the toggle to enable or disable the remote SSH service. If the status is reported as "**Not Supported**" the service may still be available, but status notifications may not be enabled. To enable status notifications for SSH, use the management software for the device. By default, SSH is set to port 22. If the SSH service is running on a non standard port, enter the correct port by clicking on the edit button and entering the correct port value.

Telnet Status:

If the currently selected device supports remote Telnet log in, the Telnet service for the device can be controlled by D-View 7. Use the toggle to enable or disable the remote Telnet service. If the status is reported as "**Not Supported**" the service may still be available, but status notifications may not be enabled. To enable status notifications for Telnet, use the management software for the device. By default, Telnet is set to port 23. If the Telnet service is running on a non standard port, enter the correct port by clicking on the edit button and entering the correct port value.

Web Status:

If the currently selected device supports remote Web log in, the status of the SSH service for the device can be controlled by D-View 7. Use the toggle to enable or disable the remote SSH service. If the status is reported as "**Not Supported**" the service may still be available, but status notifications are not enabled. To enable status notifications for SSH, use the management software for the device. By default, Web Status is set to port 80. If the remote Web log in service is running on a non standard port, enter the correct port by clicking on the edit button and entering the correct port value.

Settings	Port	Status
SSH Status	-	OFF
Telnet Status	23 	 ON 
Web Status	80 	 ON 

Settings	Port	Status
SSH Status	-	OFF
Telnet Status	23 	 ON 
Web Status	80 	 ON 

Settings	Port	Status
SSH Status	-	OFF
Telnet Status	23 	 ON 
Web Status	80 	 ON 

Options for Managed Switches

SNTP / NTP Status: This option shows whether or not the device currently selected is configured to send status updates for NTP. To configure this option, use the management software for the device.	<div>SNTP / NTP Status</div> <div>OFF</div>
DHCP Server Status: This option shows whether or not the device currently selected is configured to send status updates for DHCP. To configure this option, use the management software for the device.	<div>DHCP Server Status</div> <div>Not Supported</div>
Trap Status: If the currently selected device is able to send Trap status to D-View and is not currently configured to do so, D-View 7 can attempt to configure the device. To do so, click on the "Set D-View as Trap Server" button. D-View 7 will attempt to make the necessary changes on the currently selected device and if successful, will change the interface to show that the option has been toggled on.	<div>Trap Status</div> <div>Set D-View as Trap Server</div>
Syslog Status: If the currently selected device is able to send Syslog status to D-View and is not currently configured to do so, D-View 7 can attempt to configure the device. To do so, click on the "Set D-View as Syslog Server" button. D-View 7 will attempt to make the necessary changes on the currently selected device and if successful, will change the interface to show that the option has been toggled on.	<div>Syslog Status</div> <div>Set D-View as Syslog Server</div>
Spanning Tree: If the selected managed switch supports the spanning tree protocol, D-View 7 can enable or disable the service. To enable the spanning tree protocol ensure that the on/off toggle is set to On .	<div>Spanning Tree</div> <div>ON </div>
LLDP Status: If the selected managed switch supports status updates from the Link Layer Discovery Protocol, D-View 7 can enable or disable the service. To enable LLDP status updates ensure that the on/off toggle is set to On .	<div>LLDP Status</div> <div>ON </div>
Safeguard Engine: POE Status: Engine updates ensure that the on/off toggle is set to On .	<div>Safeguard Engine</div> <div>ON </div>

If the selected managed switch supports status updates for Power over Ethernet, D-View 7 can enable or disable the service. To enable PoE status updates ensure that the on/off toggle is set to **On**.

RMON:

If the selected managed switch supports status updates for Remote Network Monitoring, D-View 7 can enable or disable the service. To enable RMON status updates ensure that the on/off toggle is set to **On**.

SSH Status:

If the currently selected device supports remote SSH log in, information on the SSH service status will be displayed here. If the status is reported as **"Not Supported"** the service may still be available, but status notifications may not be enabled. To enable SSH, see **Batch Configuration** on page 89. By default, SSH is set to port 22.

Telnet Status:

If the currently selected device supports remote Telnet log in, the Telnet service for the device can be controlled by D-View 7. Use the toggle to enable or disable the remote Telnet service. If the status is reported as **"Not Supported"** the service may still be available, but status notifications may not be enabled. To enable status notifications for Telnet, use the management software for the device. By default, Telnet is set to port 23. If the Telnet service is running on a non standard port, enter the correct port by clicking on the edit button and entering the correct port value.

Web Status:

If the currently selected device supports remote web log in, the status of the web service for the device can be controlled by D-View 7. Use the toggle to enable or disable the remote web service. If the status is reported as **"Not Supported"** the service may still be available, but status notifications are not enabled. To enable status notifications for the web service, use the management software for the device. By default, Web Status is set to port 80. If the remote Web log in service is running on a non standard port, enter the correct port by clicking on the edit button and entering the correct port value.

Monitor

The **Monitor** section contains various views that give network administrators a visual overview of different aspects of their network. The default view for Monitor is the Device View Switch tab. The Device View list all of the discovered devices by category. Topology view shows how devices are interconnected with the use of topology maps. Rack View can be used to simulate physical racks, and network stack layouts. Event View keeps a log of all received events by discovered devices in chronological order. Monitor Logs displays captured Trap and Syslog messages from devices on the network.

To learn more about Device View, please refer to **Device View** on page 76.

To learn more about Topology View, please refer to **Topology View** on page 77.

To learn more about Rack View, please refer to **Rack View** on page 83.

To learn more about Event View, please refer to **Event View** on page 85.

To learn more about Monitor Logs, please refer to **Monitor Logs** on page 86.

To learn more about the Ping Helper, please refer to **Ping Helper** on page 87.

Device View

The **Device View** section shows devices listed by type and gives more insight into certain aspects of each type of hardware than the inventory page. The default view for Monitor is the switch tab. For each category of device, the status, most recent event, and other relevant information such as IP, MAC address, and others is shown. Clicking on a device's name or IP address will open that device's detail page. Clicking on the link to the probe that it is attached to will open the probe's detail page.

To export a list of all of the devices currently in the Managed device panel view, click on **Export** to download a CSV file that can be imported into a spreadsheet application.

Devices may also be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

To reorder the current device panel view, click on the column title to sort by either ascending or descending. For some categories of devices, the column list can be customized by clicking on the "+" at the end of the column list. From the drop down menu, select which columns to display and click **Apply** to save the changes.

To manage a device, click on its corresponding **System Name**, or **IP Address** link.

The screenshots show the D-Link D-View 7 interface with the 'Monitor' tab selected. The top navigation bar includes 'Dashboard', 'Inventory', 'Monitor', 'Maintenance', 'Report', and 'System'. The 'Monitor' tab is active, and the 'Wireless Controller' category is selected. The table displays a list of devices with columns for Status, System Name, IP, MAC, Model Name, SNMP, Location, Uptime, LLDP Status, Trap Status, Syslog Status, FPM Version, FPM Version, Attached to, and Status. The 'Wireless Client' and 'PoE AP' categories are also shown, each with their respective device lists.

Status	System Name	IP	MAC	Model Name	SNMP	Location	Uptime	LLDP Status	Trap Status	Syslog Status	FPM Version	FPM Version	Attached to	Status
●	WLC-001	10.10.10.10	00:00:00:00:00:00	D-Link WLC-001	●	0-000	0 days, 0:00:00	●	●	●	1.0.0.0	1.0.0.0	Local Probe	Not Supported

Topology View

The Topology View creates network maps based on the interconnecting devices that have been discovered by a probe on a subnet. The default Topology View is the initial probe that was installed on the D-View 7 server system. Additional probes, and subnets are listed in the probe list, located on the left side of the screen.

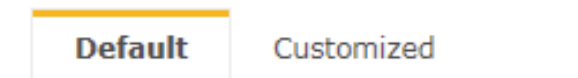

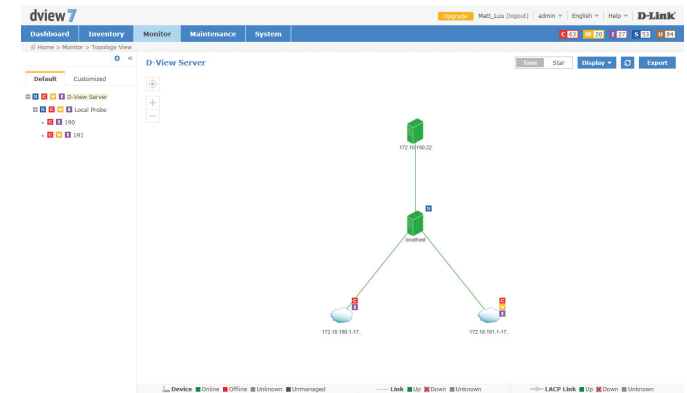

Clicking on the gear icon will display a menu that can be used to toggle the display of certain event levels for the devices that are shown in the topology map. Click the "<<" icon to hide the topology list.

The Topology View always shows the Default tab, which contains the D-View 7 probe, its subnet, and all devices on the subnet that have been discovered. To customize the view, click on the Customized tab. To create a new topology, click on the "+" located at the upper left hand corner of the topology list.

This will open the Create New Topology wizard. To generate a topology, choose to either Automatically, or Manually generate a topology.

If Automatically generating a topology, choose a central switch, will be the starting point for the topology map. Next, select the number of hops that should be included in the topology map. A list of linked devices will be shown that will be used to create the topology map. Click **Next** to continue.

If Manually generating a topology, select the devices that should be used from the list of available devices. Click **Next** to continue.

Create New Topology

1. Choose Device

Topology Generate Way

☒ Automatically: Select one device and set hops to generate the topology

☐ Manually: Generate the topology of selected devices

Choose a Central Switch* Choose one item

Analysis topology within Hops of chosen devices 2 Hops

System Name	IP	D-View Managed	Model Name	Device Type	Probe	Location	Label
No Data Found							

Next

Enter a name for the topology map that will be shown in the topology list.

Choose a data source for the links. To use the default topology which can be modified later, choose **Synchronization with system**. To define a custom topology, choose **User-defined**. Optionally, enter a description to help identify the topology map.

Next, select the display type for the topology map. A star topology will show connections, starting from the central switch, moving outwards by the specified number of hops. A tree view reorients the same information in a top down view, starting with the central switch and moving downward by the specified number of hops.

The central device for display can also be changed by clicking on the drop down menu and selecting any listed device to be used as the starting point. Leaving the **Auto** option checked will create the map using the central switch that was selected in the previous step. Click **Back** to make any changes, or click **Apply** to save the new topology map.

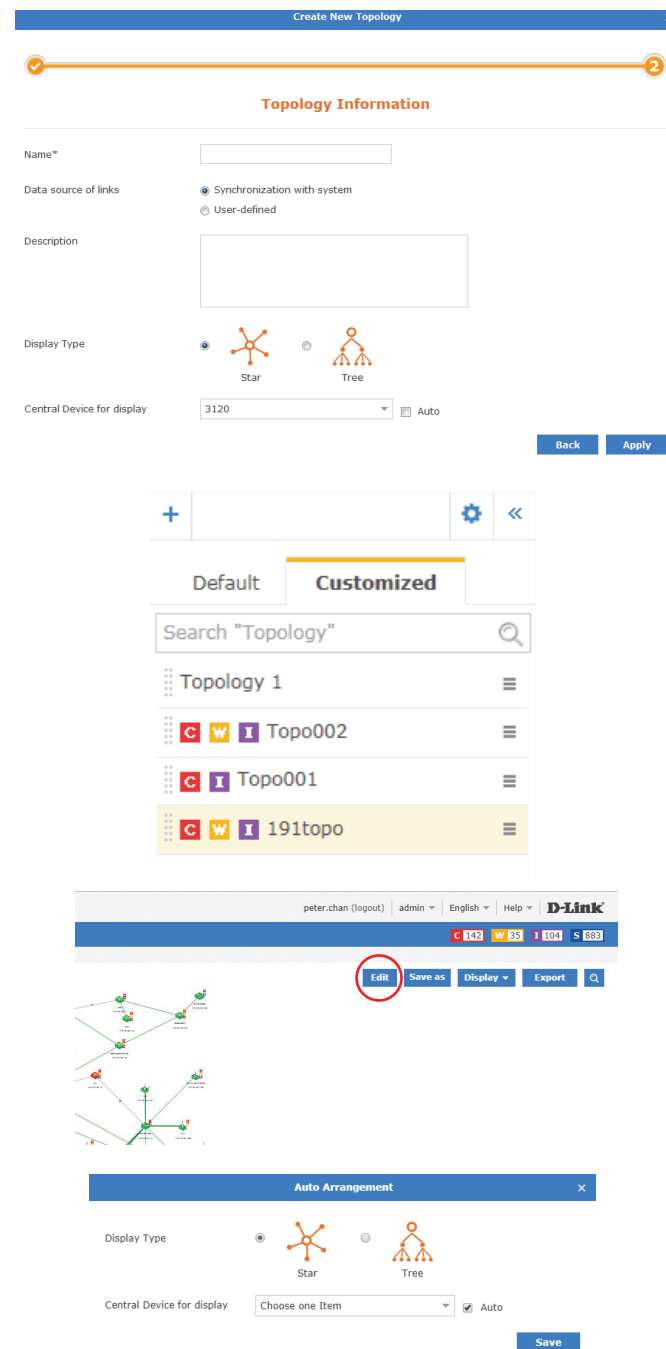

Topology maps may also be filtered by entering a part or the whole name of the topology label into the search box.

The topology list can be reordered by clicking the left part of the name, and dragging the selected item either up or down in the list.

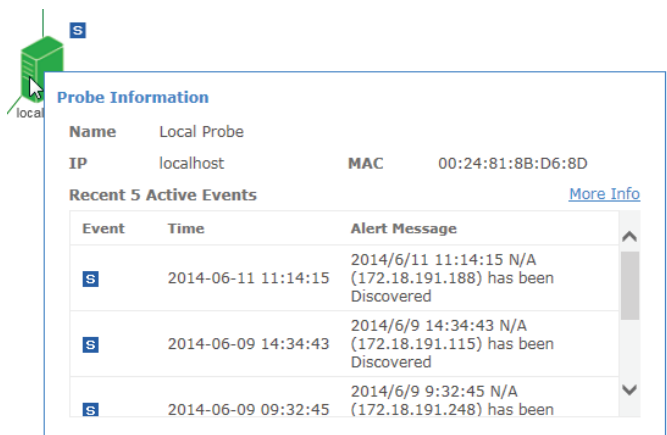

To rename or delete an topology map, click on the drop down menu item located on the right part of the topology name.

Navigating the topology map is done by left clicking anywhere on the map and dragging the map in the desired direction. Use the "+" or "-" controls to zoom in and out on the map. Clicking the target icon will zoom the map out and center it on the central switch for the current topology.

In the default topology view, the map layout can be changed from a top down tree, to a star view by going into the **Edit** mode by clicking the button in the upper-right of the topology map. In the Edit window, click the Auto Arrangement icon () in the upper-left of the topology to change the layout.

Hovering the mouse cursor over any device will open a pop up window that contains some basic information for that device, such as the devices IP address, MAC address, and recent events that originated from the device.

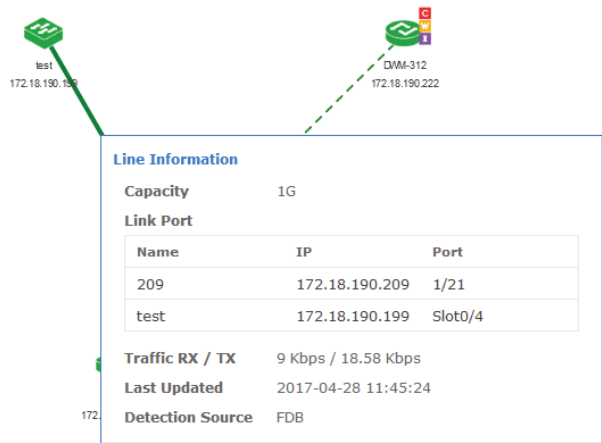

A popup window titled "Probe Information" is shown, triggered by hovering over a device icon labeled "local". The window contains the following data:

Name	Local Probe		
IP	localhost	MAC	00:24:81:8B:D6:8D

Below the table is a section titled "Recent 5 Active Events" with a "More Info" link. It contains a table of events:

Event	Time	Alert Message
	2014-06-11 11:14:15	2014/6/11 11:14:15 N/A (172.18.191.188) has been Discovered
	2014-06-09 14:34:43	2014/6/9 14:34:43 N/A (172.18.191.115) has been Discovered
	2014-06-09 09:32:45	2014/6/9 9:32:45 N/A (172.18.191.248) has been

Hovering the mouse cursor over any link will open a pop up window that contains some basic information about the link, such as the link capacity, the ports connecting the link, sent and received traffic, and the date and time the information was updated.

A popup window titled "Line Information" is shown, triggered by hovering over a link between two devices. The window contains the following data:

Line Information		
Capacity	1G	
Link Port		
Name	IP	Port
209	172.18.190.209	1/21
test	172.18.190.199	Slot0/4
Traffic RX / TX	9 Kbps / 18.58 Kbps	
Last Updated	2017-04-28 11:45:24	
Detection Source	FDB	

In the customized topology view, it is also possible to edit the connections between devices. With a customized topology selected, click on the **Edit** button.

Edit

The top section of the topology map will change, displaying the edit functions available for the current topology map.

Exit without Saving

Save and Exit

The **Auto Arrangement** button will open a pop up that enables changing the display type of the current topology map, as well as changing the central starting device.

Drawing new connections between devices is done by hovering over an existing device. A red dot will appear and the mouse cursor will change to a pencil cursor. Click and drag from the existing device to any other device to create the line.

A user-defined link has the highest priority in the topology. A user-defined topology will not be affected by the topology refreshing.

To edit the newly created link, click the line and then click the **Edit Lines** icon.

Any existing line or device can also be deleted by clicking the desired link or device and then clicking the **Delete** icon.

To support a 3rd party device:

1. If the 3rd party's information has been configured in the Customized Identified Device Model List (see **About** on page 106), and if the device supports LLDP, D-View 7 will automatically create a link with the device.

To do this, the information in the "Start Port Index" and "Port Count" fields needs to be identical with the device's SNMP MIB ifTable. These fields can be reached by going to the **About** page, clicking on the **Customized Identified Device Model List** tab, and pressing the **Edit** button in the Action column.

2. If the 3rd party device cannot fulfill the criteria mentioned above, a link can be drawn manually in the Customized Topology view.

Rack View

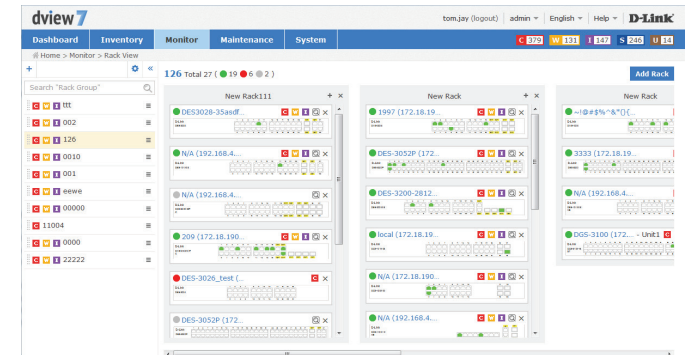

The Rack View creates virtual racks that can simulate physical racks, or be used to group devices based on preference. Multiple racks are listed in the rack list, located on the left side of the screen.

To create a new rack group click on the "+" sign in the upper left corner of the rack group column. A pop up window will open; enter a unique rack group name, and add a description to describe the rack group. Click **Create** to save the rack group to the rack group list. Labels are unique to the workspace that the user is currently in, and users in the same workspace will share labels.

The newly created rack group will appear in a column list on the left side of the browser. To add another rack group, click on the "+" sign at the top of the rack group list. To hide the rack group list from view, click the "<<" sign at the top of the rack group list. Rack groups may also be filtered by entering a part or the whole name of the rack group into the search box.

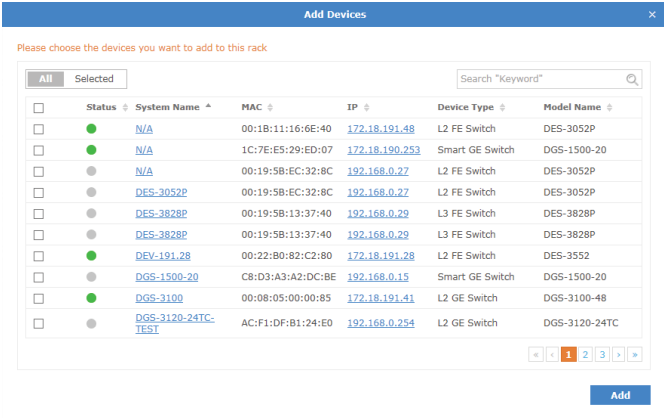

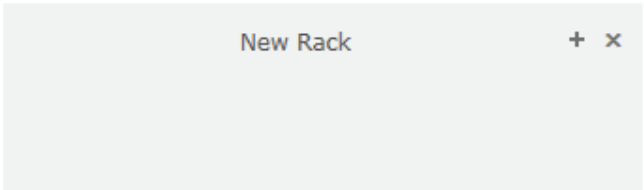

The rack group list can be reordered by clicking the left part of the label name, and dragging the selected item either up or down in the list.

To rename or delete an rack group, click on the drop down menu item located on the right part of the rack group name.

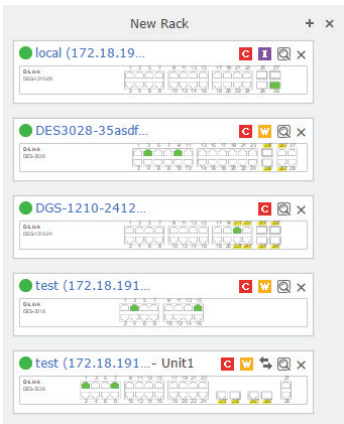

To create a rack click the **Add Rack** button. This will add an empty rack to the rack view for the current rack group. The rack will be empty, and created with the default title of "New Rack" To change the rack title, click the title and enter the desired value. To add a device to the rack, click the "+" sign in the upper right corner of the virtual rack.

Clicking the "+" sign will open a pop up window with a list of available devices. Select the devices to add the to rack and click **Add**.

Newly added devices will be added into the rack. Devices can be moved between racks by clicking and dragging the desired device to any available rack.

Event View

The **Event View** shows a list of all received events from devices that have been discovered and all system events that have taken place on the D-View 7 server. By default, the Event View shows the **Device** tab, which list events for discovered devices. To show events for the D-View 7 server, click on the **System** tab.

Each tab in **Event View** has an **Active Events** section, as well as an **Acknowledged Events** section. New events will be stored in the Active Events section until they have been marked as acknowledged. To move between each section, click on either the **Active Events** button or **Acknowledged Events** button.

To archive events, use the check box to select the event. The **Acknowledge** button will appear in the upper left corner of the Event View window.

Events may also be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

To export a list of all of the events for the currently selected section, click on the **Export** button which will download a CSV file that can be imported into a spreadsheet application.

While in the **Device** tab, clicking on the link to a source will open a new window with the detailed device view for that event.

Moving the mouse over the ellipsis (...) at then end of an entry in the Event View will display more detailed information about the event.

Monitor Logs

The **Monitor Logs** view shows a list of all received Trap and Syslog events from devices that have been discovered. By default, the **Monitor Logs** view shows the **Trap Log** tab, which list Trap events for discovered devices. To show Syslog events for discovered devices, click on the **Syslog** tab.

Events may also be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

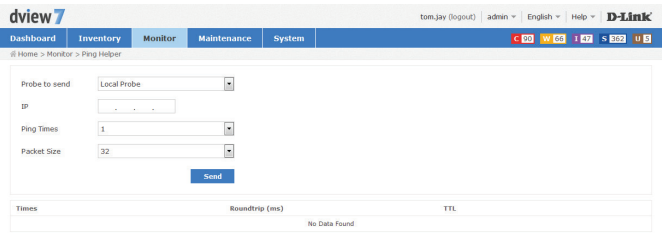

To export a list of all of the events for the currently selected section, click on the **Export** button, which will download a CSV file that can be imported into a spreadsheet application.

While in either tab, clicking on the link to a source will open a new window with the detailed device view for that event.

Ping Helper

The **Ping Helper** page is used to perform a ping test from either the local or remote probe. The IP address to be pinged, the number of pings and the packet size can be entered, and the results are shown in the bottom half of the window.

Maintenance

The Maintenance section contains **Batch Config, Firmware Management, Config Management, Task Management**.

Batch Config contains a number of different templates that can be used to configure multiple devices at the same time. It is also possible to use the built-in **Script Template** editor to create customized templates that can be saved for later use.

Firmware Management is used to deploy firmware upgrades to multiple devices at the same time.

Config Management is used to backup and restore configurations for a single or multiple devices at the same time.

Task Management is used to view and manage currently running as well as historical task.

To learn more about **Batch Config** please refer to **Batch Configuration** on page 89.

To learn more about **Firmware Management** please refer to **Firmware Management** on page 90.

To learn more about **Config Management** please refer to **Configuration Backup & Restore** on page 91.

To learn more about **Task Management** please refer to **Task Management** on page 94.

Batch Configuration

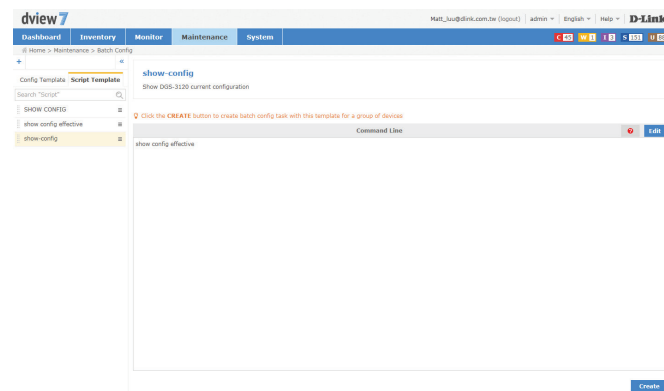

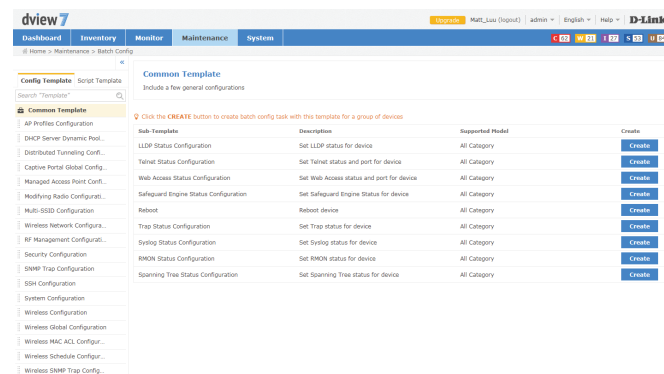

Groups of devices can be simultaneously configured or controlled using the **Batch Config** utility. There are a number of default configuration templates that can be used, which are sorted by the device type they are applicable to.

The default view for **Batch Config** is the **Common Template** section. The general configuration templates listed apply to a range of devices. To begin using a template. Click on the **Create** button. A pop up window will appear that will list the steps necessary to create a task that can either be run on a recurring basis, or one time only. The steps to complete task creation are outlined below:

1. Set the configuration behavior. For example, the **LLDP Status Configuration** task has the option to either enable or disable the LLDP status setting on a device.
2. Select the device(s) that the task will be assigned to.
3. Set the name of the task. This will be the name that the task will be identified as on the device. Optionally, set a description and a schedule to run the task.
4. Check to ensure that all of the details of the task are correct. If they are, click **Submit** to finalize the task. Otherwise, click **Back** to make any desired changes.

Customized batch configurations can also be created by using the **Script Template** function. To create a custom template, click on the **Script Template** tab and then click on the "+" sign at the top of the script template list. A pop up window will open where the custom script name, description, and custom commands can be entered. Basic guidelines for creating custom scripts can be found in the online help, which can be accessed by clicking on the  button at the upper right corner of the command line input box.

Once a custom script has been successfully created, a new task for the custom script can be made by clicking on the Create button at the lower right corner of the **Script Template** view. The process for creating a new task is the same as the one used with the pre-made batch configuration templates found in the Config Template tab.

Firmware Management

The **Firmware Management** view is used to manage the deployment and tracking of firmware to devices on the network. The default view for **Firmware Management** shows a list of devices that have been remotely upgraded using D-View 7's firmware deployment feature. The list can be sorted and searched using the advance search function. Deploying new firmware to a single device or multiple devices can be accomplished by clicking the **Firmware Upgrade** button. A pop up window will open where the firmware binary and the target devices can be selected.

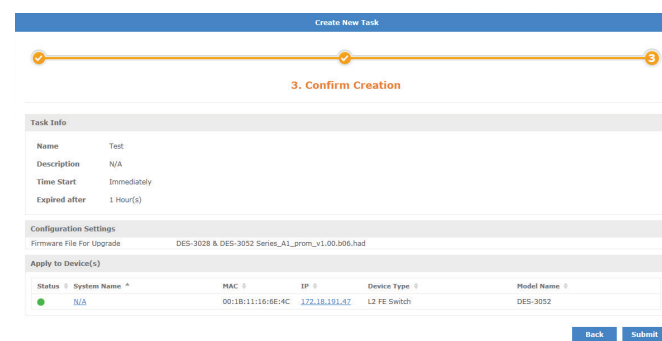

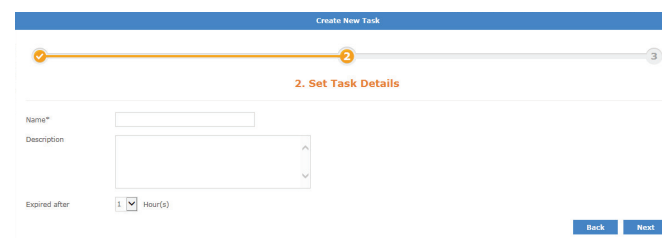

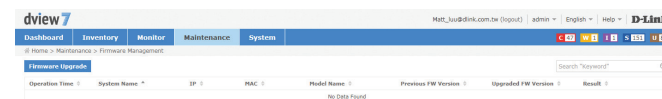

Note: Ensure that the firmware binary selected matches the type of device selected in the first step of the firmware deployment process. Selecting the wrong type of device will cause the process to not complete properly.

It is also important to follow any precautions listed on the firmware download page to ensure that the process completes without any issues.

After selecting the proper firmware binary and selecting the proper device to upload the firmware into, click **Next**. Set the task details that will be used to identify the job for that device. Optionally, set a description and a time to live for the job. The default expiration time for the firmware upgrade process is 1 hour. Click **Next** to continue.

Confirm all of the details are correct and click **Submit** to finalize the firmware upgrade process. Click **Back** to make any changes. The task will begin immediately and the status of the task can be found by going to the **Task Management** view under the **Maintenance** section. To find out more about Task Management, please see **Task Management** on page 94.

Configuration Backup & Restore

The **Config Management** view is used to backup and restore configurations for a single or multiple devices at the same time. The default view for Config Management shows a list of previous backup or restore task that have been performed. The list can be sorted by any of the listed columns, and can be filtered using the advance search feature. The **Export** button will download a copy of all the jobs currently displayed.

To backup a single device or multiple device configuration, click on the **Backup** button.

A pop up window will open which can be used to select the device(s) that will have their configurations backed up. Click **Next** to continue.

Enter a name for the task that will be used by D-View 7's Task Management feature to track the backup process. Optionally, enter a description and the frequency of the backup job that will be performed. If necessary, the start time can also be delayed, or time to live can be adjusted to allow the backup job more time to complete. Click **Next** to continue.

Expired after: 1 Hour(s)

Back Next

Confirm all of the details are correct and click **Submit** to finalize the configuration backup process. Click **Back** to make any changes. The task will begin immediately and the status of the task can be found by going to the **Task Management** view under the **Maintenance** section. To find out more about Task Management, please see **Task Management** on page 94.

To begin the configuration restore process, click on the **Restore** button. A pop up window will open which can be used to select the source file for the configuration restore process. Choosing the **System** option will use a configuration file for a device that has been successfully backed up using the D-View 7 backup process. Choosing the **System** option allows for multiple devices to be restored at the same time, provided that the device has been successfully backed up using the D-View 7 backup process previously.

The **Upload** option will allow a single device to be restored, using a configuration file that has been generated for a specific device. Click **Next** to continue.

If the System option was chosen, select the device(s) that will have its configuration restored. The device list will show the last configuration backup that was successfully performed. Devices can be filtered by using the advance search feature. Click **Next** to

Task Management

The **Task Management** view is used to view and manage currently running as well as track task that have been previously run. The default view for Task Management shows a list of current task that are being performed, as well as task that occur on a recurring basis. The list can be sorted by any of the listed columns, and can be filtered using the advance search feature. The **Export** button will download a copy of all the jobs currently displayed.

The latest results for any job can be seen by clicking on the link listed in the **Latest Result** column. Details for the job can also be found by clicking on the **Magnifying Glass** icon. Clicking on the **Pause** icon will cause the job to suspend until the **Play** icon is clicked, resuming the job. The **Trash** icon will delete the job.

To view a list of previously completed task, click on the **Historical** tab. The Historical Task list can be sorted by any of the listed columns, and can be filtered using the advance search feature. The **Export** button will download a copy of all the jobs currently displayed.

System

The System section contains **License, Discovery, User / Workspace, Sensor Settings, Notification Center, System Logs**, and **About**.

The **License** page is used to view and manage licenses for nodes as well as probes that are attached to the D-View 7 server.

The **Discovery** page is used to manage the discovery function of the different probes that are used to discover devices.

The **User/Workspace** page is used for account and workspace management.

The **Sensor Settings** page is used to create sensors that are used by devices to generate the data needed for the device dashboard widgets.

The **Notification Center** is used to generate notifications when a notification rule is matched. Notifications can be either emails or script execution.

The **System Logs** page is used to view system events that have taken place on the D-View 7 server.

The **About** page shows information related to D-View 7.

To learn more about **License** please refer to **License** on page 96.

To learn more about **Discovery** please refer to **Discovery & Probe Setting** on page 98.

To learn more about **User/Workspace** please refer to **User Management** on page 99.

To learn more about **Sensor Settings** please refer to **Sensor Settings** on page 101.

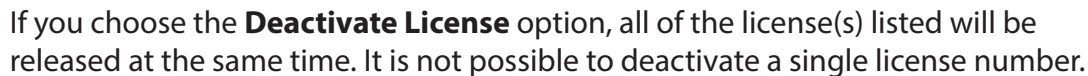

To learn more about the **Notification Center** please refer to **Notification Center** on page 102.

To learn more about **System Logs** please refer to **System Logs** on page 104.

To learn more about **About** please refer to **About** on page 106.

The License view allows the D-View 7 administrator to perform activations for adding nodes or probes, as well as managing existing licenses. The License List **Export** button will download a copy of all the data for both probes and nodes. The Probe List **Export** button will download all of the information related to probes that are currently on the network.

To deactivate a license, click on the **Deactivate License** button. This will disassociate the D-View 7 licence with the server and deactivate D-View 7. This could be used to re-allocate licenses to another server, if a server move or replacement is required, or return the server to factory defaults. This cannot be reversed, and once D-View 7 is deactivated, it is not possible to use D-View 7 until it is reset or reinstalled.

D-Link D-View 7 User Manual

To unbind licences, click the **Unbind License** button. This will disassociate the D-View 7 licence with the server, but leave you with a trial version of D-View 7. This could be used to re-allocate licenses to another server, if a server move or replacement is required. Once this has been done, a dialog box will pop up, asking you to confirm the action. Click **OK** to confirm that you wish to unbind the licenses with the server.

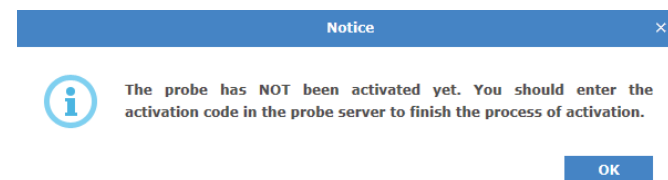

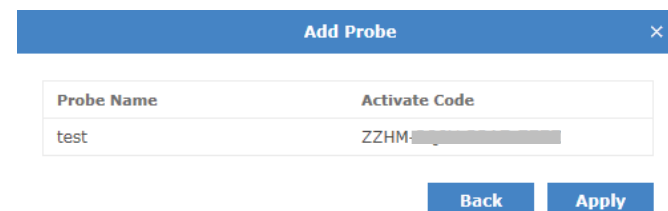

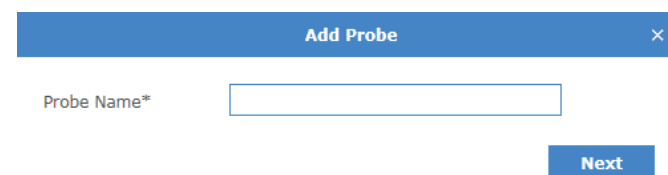

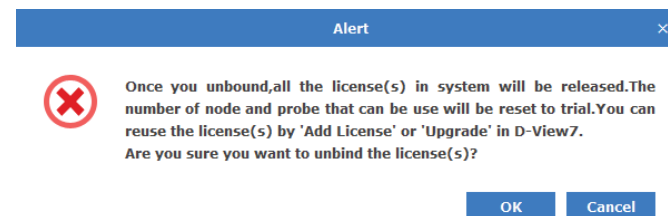

If you choose the **Unbind License** option, and D-View 7 is returned to the trial version, if you have more than 25 managed nodes or more than 2 probes, D-View 7 will stop monitoring all devices until the extra nodes and probes are removed from the system.

Activating a probe is a two part process. To activate a probe, first add the additional probe license following the activation process outlined on 51. Next, click on the **Add Probe** button in the Probe Server List section of the License view. Enter a name to help identify the probe. Click **Next** to continue.

D-View 7 will automatically assign an available license code to the newly created probe. It will also issue an activation code that will need to be entered into the probe server to activate it.

Write down the activation code, and enter it into the remote probe server to finish the probe activation process. The probe will remain inactive on D-View 7 server until the activation code has been entered and has successfully connected back to the D-View 7 server.

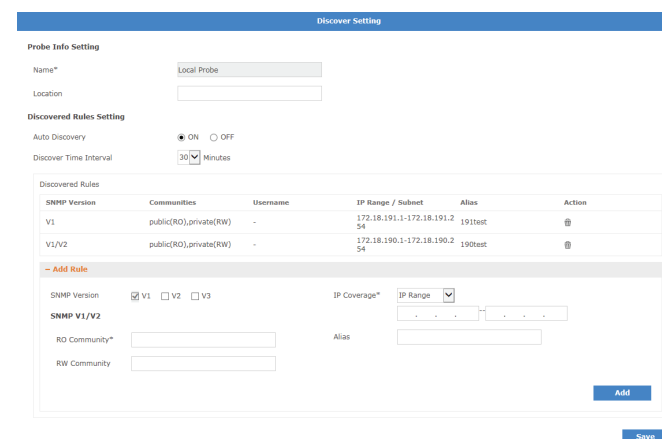

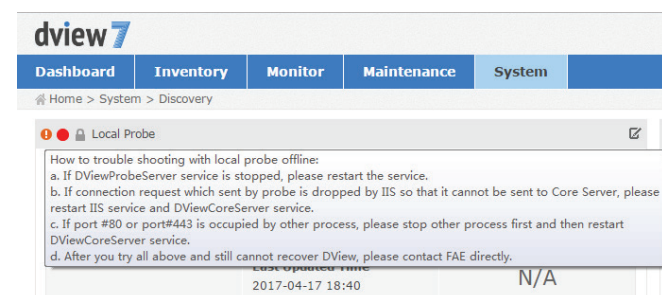

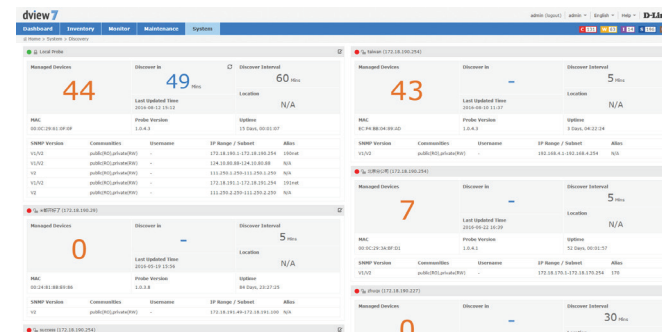

Discovery & Probe Setting

The **Discovery** view allows the D-View 7 administrator to monitor and manage active probes that are paired with the D-View 7 server. Each probe is listed in its own widget that gives details such as the probe availability, whether the probe is using HTTP or HTTPS to communicate with the central server, the name and IP address. The number of managed devices is also displayed, along with the last time the device information was updated, the next discovery time and the discover interval. The discovery rules are displayed below the probe summary information.

If the probe is offline, the Local Probe status icon will change to red and there will be an exclamation mark displayed next to the status icon. Hover over this with the mouse to display some troubleshooting information.

To make any changes to an existing probes setting, click on the **Edit** icon in the upper right corner of a probes widget. A pop up window will open that displays all of the available options and rules that have been set for the selected probe. Auto discovery must be set to **On** in order for the discovery rules to be effective. To add a new discovery rule, click on **"Add Rule"** which will expand the rule set by one line. Enter the SNMP version that will apply to the rule, the IP coverage (range or subnet), the Read Only and Read Write community values, and optionally an alias to help identify the rule. Click **Add** to save the rule. To finalize the changes to the probe, click the **Save** button.

User Management

The User / Workspace view shows all of the user accounts and all of the available workspaces. By default, the User / Workspace list will show all the user accounts for all workspaces.

Users on the D-View 7 server can be assigned to a specific workspace, which can be configured to limit the amount of or type of devices that are available to those users.

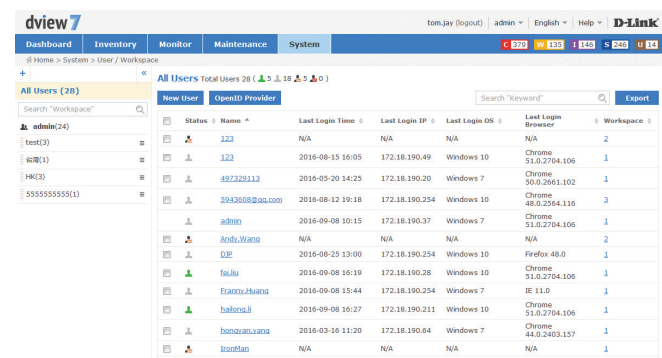

To create a new workspace click on the "+" sign in the upper left corner of the workspace list column. A popup window will open; enter a unique workspace name, and add a description to describe the workspace. Click **Next** to continue. Select the devices that will be a part of the workspace. If the selected device has any devices it depends on, such as a wireless controller, make sure to add those as well. Click **Next** to continue. For each device, set the device privileges for the workspace. Privileges can be set on both the device and its modules. Click **Submit** to save the workspace to the workspace list.

The newly created workspace will appear in a column list on the left side of the browser. To hide the workspace list from view, click the "<<" sign at the top of the workspace list. Workspaces may also be filtered by entering a part or the whole name of the workspace name into the search box.

The workspace list can be reordered by clicking the left part of the workspace name, and dragging the selected item either up or down in the list.

To rename or delete a workspace, click on the drop down menu item located on the right part of the workspace name.

The **Export** button will download a copy of all the jobs currently displayed.

The screenshot shows the 'dview7' interface with the 'System' tab selected. The 'All Users' section displays a table of users and their assigned workspaces. The table has columns for Status, Name, Last Login Time, Last Login IP, Last Login OS, Last Login Browser, and Workspace. The workspace list on the left includes 'admin(24)', 'test(3)', '600(1)', 'HK(3)', and '555555555(1)'.

Status	Name	Last Login Time	Last Login IP	Last Login OS	Last Login Browser	Workspace

To add a new user to the D-View 7 Server, click on the **New User** button.

A pop up window will open. The Account Source can be set to Local or OpenID.

If an Account Source of **Local** is chosen, enter the user's email address, name, password, confirm the password, enter a description (optional) and choose an account type of **Admin** or **User**.

If the account is set to **User**, a Privilege box will appear that will allow the administrator to set the user account privileges. The account privileges are based on workspaces, so it is important to ensure that the workspace has the correct permissions for the devices that the user is going to be assigned to.

If an Account Source of OpenID is chosen, enter the user's email address, name, description (optional) and choose an account type of **Admin** or **User**.

Click **Submit** to save the newly created user account.

An activation email will be sent to the email address specified in the email address field.

There is no limit to the number of user accounts or workspaces on the D-View 7 server.

Create New User

Before create a new user, please make sure the SMTP server ([System > About](#)) has been set correctly, since an activation email need to be sent to this user's email address.

Sensor Settings

The **Sensor Settings** view shows a list of available sensors based on the type of data collected by the sensor. The sensors configured here will show up as a widget on the dashboard of a device that the sensor is assigned to. Certain sensors will not be applicable to specific types of devices (e.g. Wireless sensors for switches or other devices that have no wireless capability). To create a new sensor for a single device or multiple devices, select the sensor type based on the desired data to be collected, and click on the **New Sensor** button.

A pop up window will open. Enter a unique name that will be used to identify the sensor in the sensor list. Using the drop down menu, select a time interval for how often the sensor will collect data from the assigned device(s). Optionally, enter a description to help identify the sensor. Click **Next** to continue.

Sensors can be configured to send alerts based on certain thresholds. An administrator can also configure notifications to be sent when either an informative event, warning event, or critical event is detected on a device. Depending on the type of sensor, notifications can also be sent for certain types of devices (e.g. Wireless AP sensors can apply to a standalone AP, a managed AP, or a rogue AP). To configure a notification, first enable the event level desired. The hierarchy of event levels always goes from **Info**, to **Warning**, to **Critical**. To enable a **Critical** level event, **Info** and **Warning** must also be enabled. Next set the threshold level. For some sensors this will be a numerical value, for other sensors such as **CPU Utilization** it will be a percentage. Set the number of times the event must be detected. If an event is detected multiple times, the alert can also be escalated to a higher priority by enabling **Escalation**. Set escalation to **On** or **Off**, and set the number of times the event must be repeated before being escalated. Escalation can only be enabled if the higher priority alert level is also enabled. To reset all entered values, click the **Reset** button. Click **Next** to continue.

Select the device(s) that will be assigned to the new sensor. Devices can be filtered by using the advance search feature. Click **Finish** to save the new sensor. To view the new sensor, go to the Inventory View and find a device that the newly created sensor was assigned to. The sensor will appear as a new widget within the devices detailed dashboard view.

The screenshot displays the 'Create New Wireless AP Type Sensor' wizard in the D-Link D-View 7 interface. The wizard consists of three steps: 1. Set Sensor Information, 2. Set Alert Rule, and 3. Apply to Device(s).

Step 1: Set Sensor Information

Fields include:

- Name*:
- Interval: Min
- Description:

Step 2: Set Alert Rule

Setting Event Trigger Rules:

Settings	Info Event	Warning Event	Critical Event
Standalone AP	Event: <input type="radio"/> ON <input type="radio"/> OFF	Event: <input type="radio"/> ON <input type="radio"/> OFF	Event: <input type="radio"/> ON <input type="radio"/> OFF
Managed AP	Trigger: <input type="text"/> >=	Trigger: <input type="text"/> >=	Trigger: <input type="text"/> >=
Total AP	Alert when trigger repeat for: <input type="text"/> Times	Alert when trigger repeat for: <input type="text"/> Times	Alert when trigger repeat for: <input type="text"/> Times
Rogue AP	Escalation: <input type="radio"/> ON <input type="radio"/> OFF	Escalation: <input type="radio"/> ON <input type="radio"/> OFF	Escalation: <input type="radio"/> ON <input type="radio"/> OFF
	Escalation when status repeat for: <input type="text"/> Times	Escalation when status repeat for: <input type="text"/> Times	Escalation when status repeat for: <input type="text"/> Times

Step 3: Apply to Device(s)

Table of devices:

Status	System Name	MAC	IP	Device Type	Model Name	Label
<input type="checkbox"/>	123	00:17:9A:95:20:14	172.18.191.05	Unified Switch	DWS-4026	N/A

Notification Center

The **Notification Center** shows the notification rules that have been configured for devices in D-View 7. The name of the notification rule is entered, and then the sensor type, device and alert conditions are selected. These are the conditions that will trigger the alert. After this, the notification method is chosen. This can be an email notification or script execution.

Name	Status	Source Device	Sensor	Trigger Event	Method	Latest Notify Time	Latest Result	Action
日月	Active	0	HTTP Sensor - 010101		Send Email	N/A	-

edd	Active	6	CPU Utilization		Send Email	2016-09-08 14:24	-	

20 Records per page

Click the **Add Notification Rule** button to add a notification rule. Enter the name of the rule and a description and press **Next** to continue.

1. Set Profile Information

Name*

Description

Next

Choose the sensor type. This can be **CPU Utilization, Memory Utilization, Ping, Syslog, Trap, Wired Error Packet, Wired Traffic, Wireless AP Type, Wireless Client, Wireless Error Packet, Wireless Traffic (bit), or Wireless Traffic (packet)**. Depending on the sensor type chosen, a sensor (or device probe) can also be chosen.

Select the devices to apply to notification rule to. This can be done in the choose device section of the window, and different devices will be displayed, depending on the sensor type chosen. Use the search feature to search for devices in the table, and use the **Notify when the alarm happen** tick boxes to choose the alert level to provide notifications on. Ensure that at least 1 device is selected, and click **Next** to continue.

2. Set Conditions

Sensor Type: **CPU Utilization**

Choose Device:

1 2 3 4 5

Set the notification method. If the email notification is chosen, enter the email address to receive notifications and press **Add** to add the email address to the notification rule. If the execute script option is chosen, a command line window is displayed to enter the command that needs to be executed on the device being matched by the notification rule. Choose to apply the script to itself or other devices. If the email notification was chosen, press **Finish**, or if the execute script option was chosen, press **Next** to continue.

If the execute script option was chosen, use the choose device section of the window to choose the device to apply the command to. Ensure that at least 1 device is selected, and click **Next** to continue.

Enter the connection method (SSH or Telnet), the username and password required to connect to the device. Ensure that one set of credentials has been entered, and click **Next** to continue.

Optionally, enter an email address to receive the output from the script and press **Add** to add the email address to the notification rule. Click **Finish** to create the notification rule.

System Logs

The **System Logs** view shows a list of all events that have taken place on the D-View 7 server.

Events may be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

To export a list of all of the events, click on **Export** to download a CSV file that can be imported into a spreadsheet application.

Trap Editor

The **Trap Editor** allows the D-View 7 administrator to manage the SNMP traps on the system. New traps can be added, traps can be deleted, and a description can be given to the traps, so that they can be more easily identified.

Click **Add** to add a new trap or click the **Edit** button next to an existing trap to display the Add Trap OID Description window. Enter the OID, OID description and select the OID type. This can be Trap OID or Binding Variable OID. Press **Save** when complete.

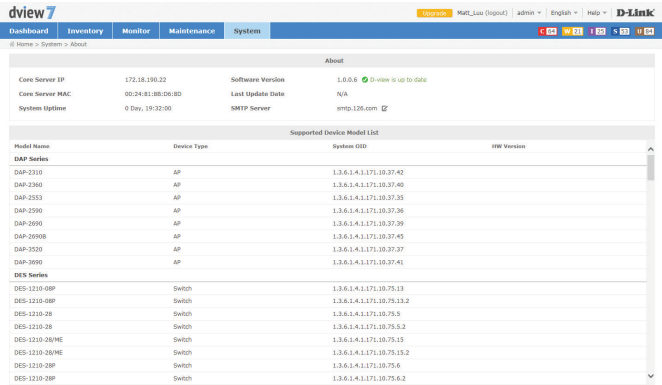

About

The **About** view shows the D-View 7 administrator details relevant to the D-View 7 server such as IP, MAC address, system uptime, and software version. By default, the **About** view shows the **Support Device Model List** tab, which list all of the devices that the current version of D-View 7 that is installed is compatible with. To show customized identified devices, click on the **Customized Identified Device Model List** tab.

Devices may be filtered by entering a keyword into the search box. Available search options will automatically appear under the search box, select the field to filter the results by. The advance search will allow for multiple filtering criteria.

Devices in the **Customized Identified Device Model List** tab can be edited by clicking on the **Edit** icon. This will pop up a window that will allow the administrator to input custom values for the **Device Type**, **Model Name**, **Hardware Version**, and **Vendor**.

The **About** view also allows the administrator to set the email settings for D-View 7 server. To edit the email settings used, click on the **Edit** icon next to **SMTP Server**. This will pop up a window that will allow the administrator to set the proper hostname and credentials that D-View 7 will use to send emails.

MongoDB Database Upgrade

Introduction

This tool is used to upgrade MongoDB from version 2.6 to version 3.2. It can be downloaded from the <http://dview.dlink.com/> website.

System Requirements

Please see **System Requirements** on page 9 for more information.

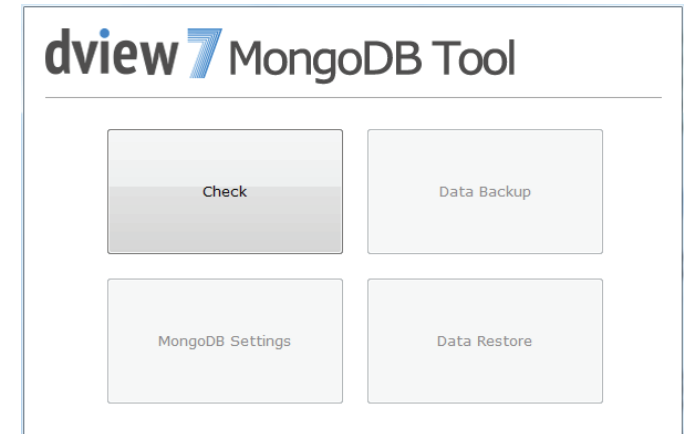

Procedure

1. Launch the D-View 7 MongoDB upgrade tool application.
2. Read the utility usage announcement on the first page and press **Agree** if you understand and wish to proceed with the upgrade. If not, close the window to exit the upgrade tool.

3. The main page displays the **Check**, **Data Backup**, **MongoDB Settings**, and **Data Restore** options. When running the tool for the first time, the **Check** button is the only button available, and the remaining buttons become available after the check tool has been run.

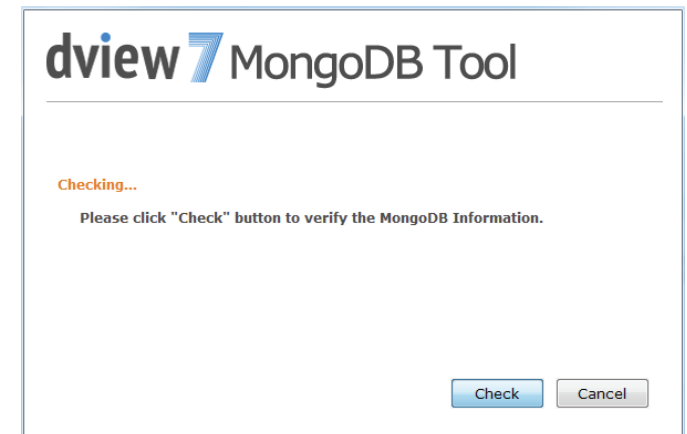

Click the **Check** button to check the MongoDB environment on the PC on which you are running the tool.

4. After clicking the **Check** button, a confirmation screen will be displayed. Click **Check** to begin the check, or press **Cancel** to return to the main screen.

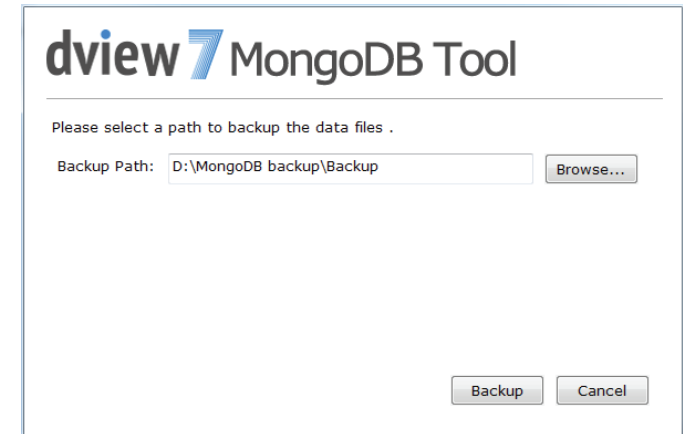

A status message will be displayed, depending on the outcome of the check. Look at **MongoDB Database Upgrade Check Results** on page 115 for more information. Correct any problems and re-run the upgrade tool, until all checks pass.

5. Once the check has been completed successfully, the **Data Backup** button will be displayed. Click this to perform a backup of the database before performing the upgrade.

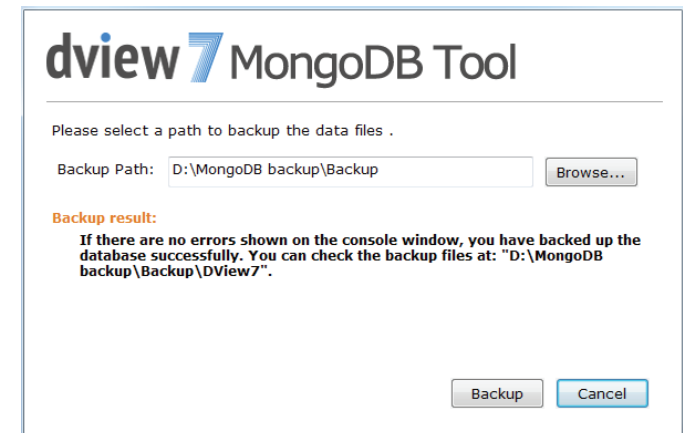

6. After clicking the **Data Backup** button, a window is displayed to choose the path of the backup. Enter the path manually or click **Browse...** to choose a path on the PC.

By default, a "Backup" folder will be created in the same folder as the upgrade tool. Press **Backup** to start the backup, or press **Cancel** to return to the main screen.

7. A dialog box will be displayed with the output of the backup, and the backup will be put in the DView7 sub-folder of the folder selected above.

When complete, and if the backup is successful, press **Cancel** to return to the main screen.

8. On the main page, click the **MongoDB Settings** button to either upgrade the MongoDB, register a Windows service, or install MongoDB. A different option will be available, depending on the status of MongoDB on the PC on which you are running the tool.

- i. If the **Upgrade** button is displayed:

Enter the path to the MongoDB installation or press **Browse...** to choose a path on the PC.

Note: make sure that you have backed-up your database using the backup option of this tool if you plan to upgrade the database of your existing installation. The original data folder will be emptied.

Tick the "Yes, I have backed-up the original database" box and press **Upgrade** to start the upgrade, or press **Cancel** to return to the main screen.

The status of the upgrade will be displayed below the installation path. When the upgrade is complete, press **Cancel** to return to the main screen.

The screenshot shows the 'dview7 MongoDB Tool' window. The title bar says 'dview7 MongoDB Tool'. The main text says 'Please select the install path for MongoDB 3.2!'. Below this is a text field labeled 'MongoDB Path:' followed by a 'Browse...' button. An 'Attention:' section in orange text says: 'If you selected the original MongoDB path to do the upgrade, please make sure you have backed-up your database, as the original "data" folder will be emptied.' Below this is a checkbox labeled 'Yes, I have backed-up the original database.' At the bottom right are 'Upgrade' and 'Cancel' buttons.

- ii. If the **Register** button is displayed:

Enter the path to the MongoDB "bin" folder or press **Browse...** to choose a path on the PC.

Press **Register** to register the Windows service, or press **Cancel** to return to the main screen.

When the service registration is complete, press **Cancel** to return to the main screen.

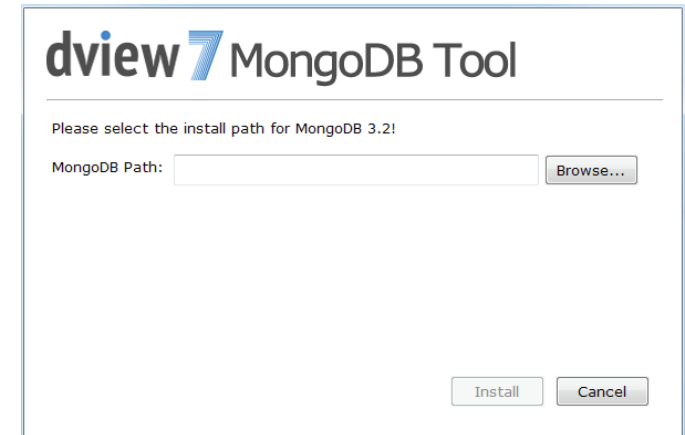

The screenshot shows the 'dview7 MongoDB Tool' window. The title bar says 'dview7 MongoDB Tool'. The main text says 'Please select the installed MongoDB 3.2 "bin" path.' Below this is a text field labeled 'MongoDB Path:' followed by a 'Browse...' button. At the bottom right are 'Register' and 'Cancel' buttons.

iii. If the **Install** button is displayed:

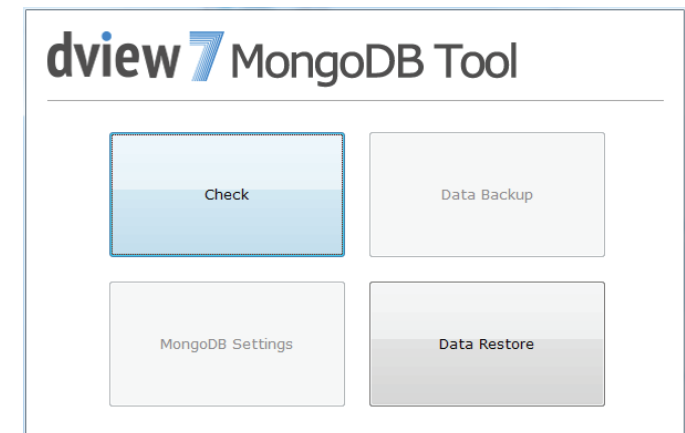

Enter the path for the MongoDB installation or press **Browse...** to choose a path on the PC.

Press **Install** to start the installation, or press **Cancel** to return to the main screen.

When the installation is complete, press **Cancel** to return to the main screen.

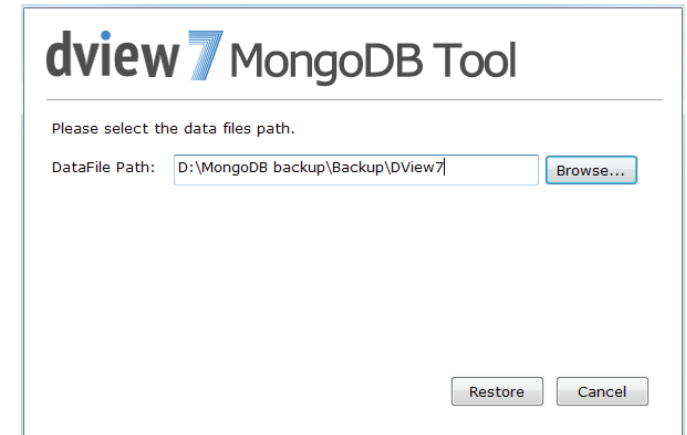

9. If MongoDB is installed and registered as a Windows service, the **Data Restore** button will be displayed. Click this to restore the MongoDB 2.6 database backup taken at the beginning of the process to MongoDB 3.2.

10. After clicking the **Data Restore** button, a window is displayed to choose the path of the backup files. Enter the path manually or click **Browse...** to choose a path on the PC.

Press **Restore** to start the restoration, or press **Cancel** to return to the main screen.

11. A dialog box will be displayed with the output of the backup. The key word "done" will be displayed at the end of the output if the restoration was successful. If there was a problem with the process, read the troubleshooting section below for more information.

When complete, press **Cancel** to return to the main screen.

Troubleshooting

The following error messages may be displayed when using the MongoDB upgrade tool **Data Backup** or **Data Restore** options.

Message	Solution
Failed: error connecting to db server: no reachable servers	<ol style="list-style-type: none">1. Try to start the MongoDB service in the Windows service manager.2. If the service cannot be started. Please check the "Mongo.config" at the MongoDB install "bin" path, e.g.: D:\MongoDB\bin. The contents of the "Mongo.config" should like follows: <pre>directoryperdb = true logappend = true storageEngine = wiredTiger wiredTigerDirectoryForIndexes = true wiredTigerCollectionBlockCompressor = zlib serviceName = MongoDB serviceDisplayName = MongoDB logpath = D:\MongoDB\log.txt dbpath = D:\MongoDB\data</pre>3. When MongoDB service started, do the backup or restore again.

Message	Solution
<p>Failed: DView7.Bas_Template: error reading database: not authorized on DView7 to execute command { listCollections: 1, cursor: { batchSize: 0 } }</p>	<ol style="list-style-type: none">1. Open the "Mongo.config" in the MongoDB install "bin" path, e.g.: D:\MongoDB\bin.2. Search for the keyword "auth" in the file. If it exists with an entry of "auth = true", remove it. If it does not exist: Run "cmd" as administrator Enter "sc stop MongoDB" and press Enter Enter "sc delete MongoDB" and press Enter Click the "Check" button to do the environment check If the "MongoDB Settings" button was enabled, click it to register the Windows service.3. Restart the MongoDB service in the Windows service manager.4. When MongoDB service started, do the backup or restore again.

MongoDB Database Upgrade Check Results

MongoDB Version	MongoDB Service Status	Result	Button Status
2.6.5	Be registered as windows service named as "MongoDB"	You have already installed both MongoDB 2.6 and MongoDB 3.2 and MongoDB 2.6 is registered as a Windows service. You can use the "Database Backup" feature to back up the D-View 7 database and the "MongoDB Settings" feature to install, upgrade or register MongoDB 3.2.	Enabled: Data Backup MongoDB Settings Disabled: Data Restore
2.6.5	Never be registered as windows service; No service named "MongoDB"	You have already installed MongoDB 2.6, but it has not been registered as a Windows service. You can use the "MongoDB Settings" feature to upgrade it to MongoDB 3.2, register it as a Windows service, and then use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: MongoDB Settings Disabled: Data Restore Data Backup
3.2.6	Be registered as windows service named as "MongoDB"	You have already installed MongoDB 3.2 and registered it as a Windows service. You can use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: Data Restore Disabled: Data Backup MongoDB Settings
3.2.6	Never be registered as windows; No service named "MongoDB"	You have already installed MongoDB 3.2, but it has not been registered as a Windows service. You can use the "MongoDB Settings" feature to register it as a Windows service and use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: MongoDB Settings Disabled: Data Backup Data Restore

MongoDB Version	MongoDB Service Status	Result	Button Status
2.6.5 3.2.6	3.2.6 was registered as windows service named as "MongoDB"	You have already installed both MongoDB 2.6 and MongoDB 3.2 and MongoDB 3.2 is registered as a Windows service. You can use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: Data Restore Disabled: Data Backup MongoDB Settings
2.6.5 3.2.6	2.6.5 was registered as windows service named as "MongoDB"	You have already installed both MongoDB 2.6 and MongoDB 3.2 and MongoDB 2.6 is registered as a Windows service. You can use the "Database Backup" feature to back up the D-View 7 database and the "MongoDB Settings" feature to install, upgrade or register MongoDB 3.2.	Enabled: Data Backup MongoDB Settings Disabled: Data Restore
2.6.5 3.2.6	One of them was registered as windows service named as "MongoDB", but the tool cannot analysis which one supply the service.	You have already installed both MongoDB 2.6 and MongoDB 3.2 and one of them is registered as a Windows service. Please uninstall the unregistered one first.	Enabled: Null Disabled: Data Restore Data Backup MongoDB Settings
2.6.5 3.2.6	Both them were not be registered as windows; No service named "MongoDB"	You have already installed MongoDB 2.6 and MongoDB 3.2, but they have not been registered as a Windows service. You can use the "MongoDB Settings" feature to register MongoDB 3.2 as a Windows service and use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: MongoDB Settings Disabled: Data Restore Data Backup

MongoDB Version	MongoDB Service Status	Result	Button Status
No 2.6.5 No 3.2.6	No "MongoDB" service	There is no MongoDB on this PC. You can use the "MongoDB Settings" feature to install MongoDB 3.2, register it as a Windows service, and then use the "Database Restore" feature to restore the backed up files to MongoDB 3.2.	Enabled: MongoDB Settings Disabled: Data Restore Data Backup
No 2.6.5 No 3.2.6	There is a windows services named "MongoDB"	An unknown version MongoDB has been registered as a Windows service. This tool can only be used with the version of MongoDB installed by D-View 7 or this tool.	Enabled: Null Disabled: Data Restore Data Backup MongoDB Settings

Appendix B

Adding a Remote Probe

Introduction

This tool is used to install the probe software on a remote host. This is then added to D-View 7, to monitor devices that are not monitored directly by the probe software on the central D-View 7 host.

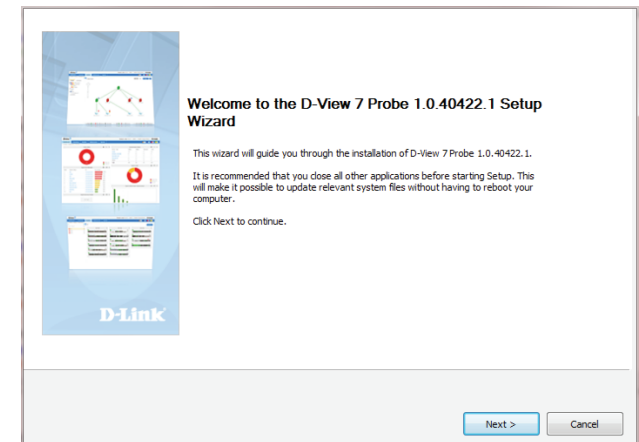

The tool can be downloaded from the <http://dview.dlink.com/> website.

System Requirements

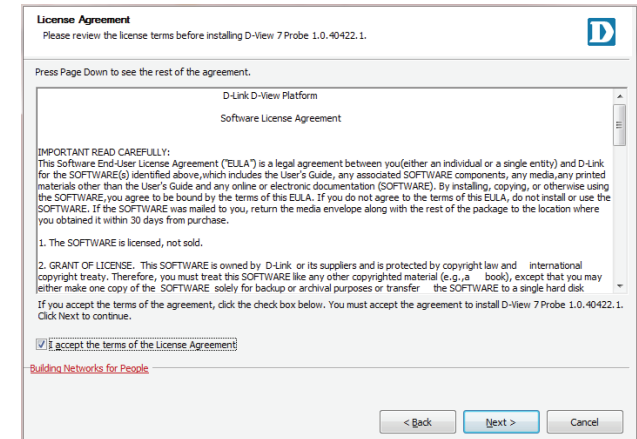

Please see **System Requirements** on page 9 for more information.

Installation Procedure

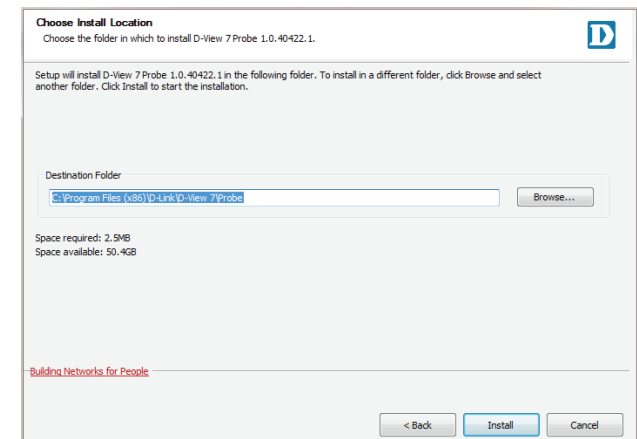

1. Launch the D-View 7 probe installation application.
2. Press **Next** on the welcome screen to start the installation process.

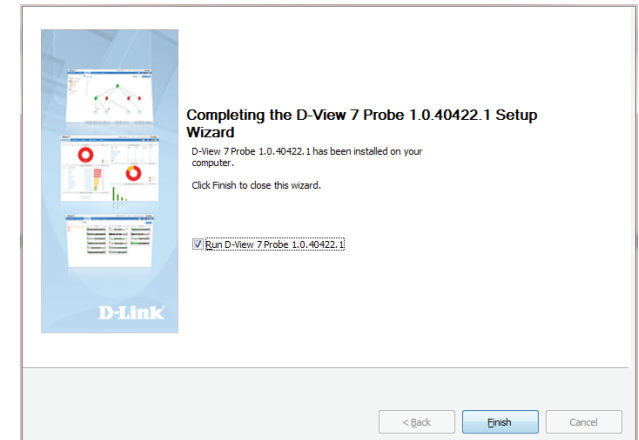

3. Read the license agreement and tick the **I accept the terms of the License Agreement** tick box if you accept the licence agreement and wish to proceed with the installation. Press **Next** to continue or press **Cancel** to exit the tool.

4. Enter the installation path for the installation or press **Browse** to choose a folder on the local file system. The space required and the space available are displayed below the installation folder. Press **Install** to install the software or press **Cancel** to exit the tool.

- When the installation has completed, a completion screen is displayed. Click the **Run D-View 7 Probe** tick box to run the software after exiting the installation tool, and press **Finish** to exit the tool.

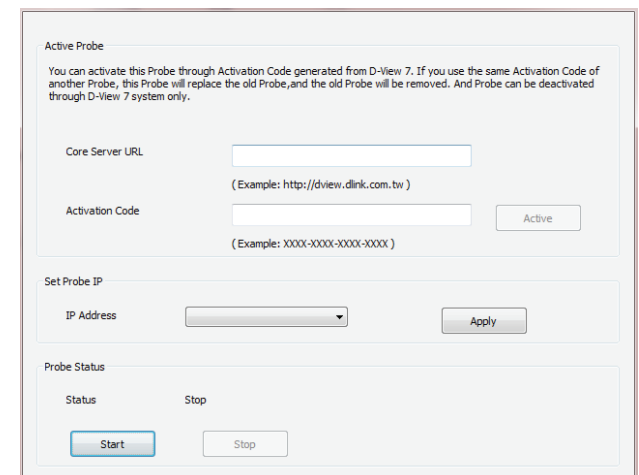

Probe Activation

Once the probe has been installed, it needs to be licensed and added to the central D-View 7 server. When the probe software is run for the first time, a wizard is displayed to configure the licensing and central server settings.

- In the Active Probe section of the window, enter the URL of the core server in the **Core Server URL** field. This can be a Fully Qualified Domain Name (FQDN) such as: <http://dview.dlink.com.tw>, or an IP address, such as: <http://192.168.0.1>. Enter the activation code in the **Activation Code** field. This is taken from the D-View 7 license page on the core server and is in the format XXXX-XXXX-XXXX-XXXX. See **License** on page 96 for more information.

If you use the same activation code of another probe, the new probe will replace the old probe, and the old probe will be removed from D-View 7. Probes can only be deactivated through the central D-View 7 interface.

2. In the Set Probe IP section of the window, select the local probe **IP Address** to be used with the probe software.
3. In the Probe Status section of the window, the local probe status is displayed. Press the **Start** button to start the probe software, and press **Stop** to stop the probe software.

Probe Discovery

Access the Discovery page on the central server to set the probe discovery rules. See **Discovery & Probe Setting** on page 98 for more information.

Appendix C

Accessing D-View 7 using HTTPS

Introduction

This is used to configure Microsoft Internet Information Services (IIS) to be accessible using HTTPS. This allows D-View 7 to be accessed either from the Internet or a local LAN using a secure connection.

System Requirements

In this example, IIS 7 is used, but the steps should be similar for any supported Windows Server operating system. Please see **System Requirements** on page 9 for more information.

In addition to the software requirements, a signed certificate is required. This can either be a self-signed certificate or a certificate signed by a certificate authority. For this example, a self-signed certificate is used, but the process should be similar for a certificate signed by a certificate authority.

The Microsoft URL Rewrite Module 2.0 for IIS 7(x64) software package is also required for this example. This can be downloaded from the Microsoft Download Center.

Installation Procedure

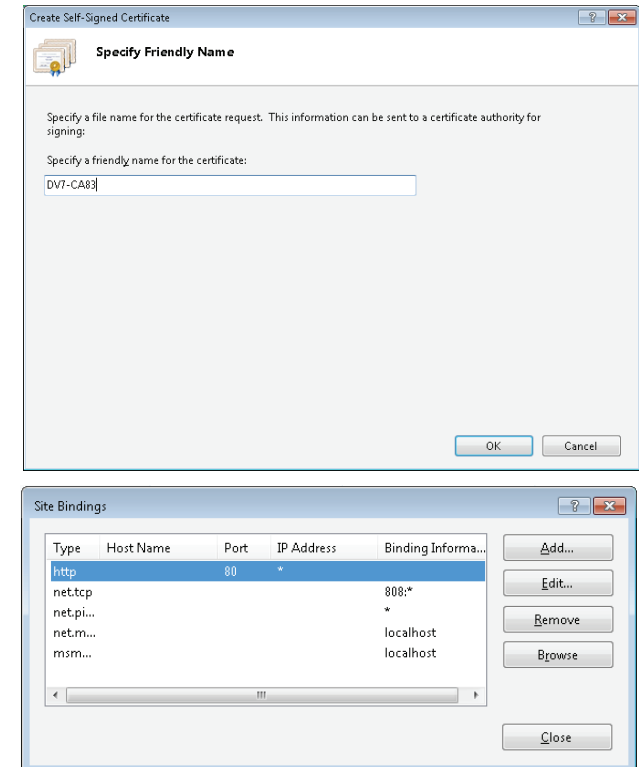

1. Download and install the Microsoft URL Rewrite Module 2.0 for IIS 7(x64) package. Once this is complete, restart IIS by using the IIS Manager or by using the CLI. With the IIS Manager open and the server name selected in the Connections panel, you should see the URL Rewrite option displayed in the main window.
2. With the server name selected in the Connections panel, open the Server Certificates tool to launch the Server Certificates interface. In the Actions panel, select **Create Self-Signed Certificate** to launch the Create Self-Signed Certificate tool.

3. In the Create Self-Signed Certificate tool, specify a name for the certificate. Press **OK** to continue or **Cancel** to exit. This should now show up in the Server Certificates interface.

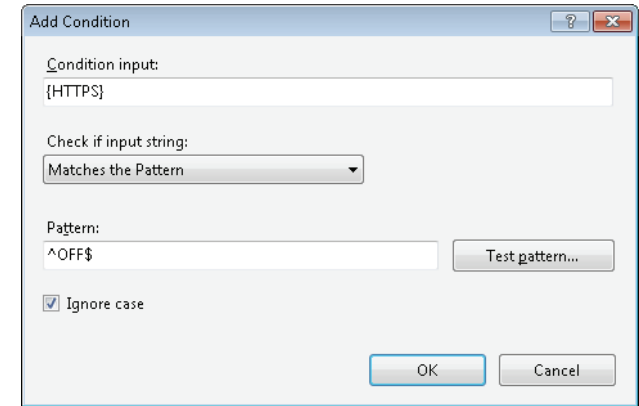

4. In the Connections panel, right-click the Default Web Site entry and select **Edit Bindings**. In the Site Bindings window, click the **Add** button and choose https as the **Type**. Choose the certificate created earlier in the **SSL certificate** field and press **OK** to continue or **Cancel** to exit. Press **Close** to exit the Site Bindings tool.

5. With the server name selected in the Connections panel, select the URL Rewrite tool and click **Add Rule(s)...** in the Actions panel which is displayed. In the Add Rule(s) window, under Inbound rules, select Blank rule and press **OK** to continue or **Cancel** to exit.

6. In the Edit Inbound Rule window, under **Name**, give the rule a name such as "HTTP to HTTPS redirect". In the Match URL section, under **Pattern**, enter a pattern such as "(.*)"

7. In the Conditions section of the Edit Inbound Rule window, click **Add...** and enter a **Condition input** of "{HTTPS}". Under **Pattern**, enter a pattern of "^OFF\$" and press **OK** to continue or **Cancel** to exit.
8. In the Action section of the Edit Inbound Rule window, under **Action type**, choose an **Action type** of Redirect. Under Action Properties, enter a **Redirect URL** of "https://{HTTP_HOST}/{R:1}" and a **Redirect type** of Found (302). In the Actions panel, press **Apply** to save the settings or **Cancel** to lose the settings.
9. It should now be possible to access D-View 7 using HTTPS. Try accessing D-View 7 using a URL such as https://<hostname or IP>/DView7/.

Appendix D

Uninstalling MongoDB Manually

Introduction

Uninstalling MongoDB manually may be required if MongoDB is not removed as part of the uninstallation process, or if D-View 7 is installed in a high availability environment and MongoDB is installed on a different server to the D-View 7 server.

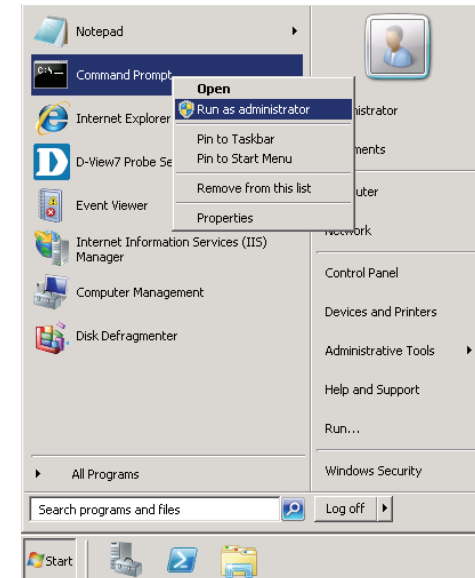

See **Uninstallation** on page 63 for more information on the uninstallation process.

System Requirements

Please see **System Requirements** on page 9 for more information.

Uninstallation Procedure

1. On the server that MongoDB is installed on, go to: **Start > All Programs > Accessories**, and right-click **Command Prompt** and choose **Run as administrator**.

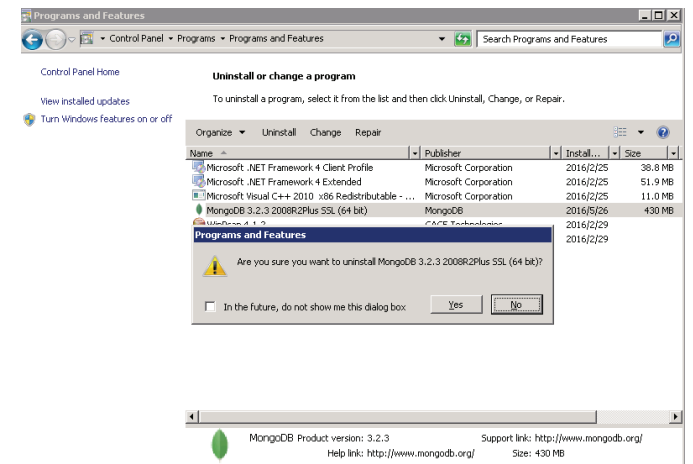

2. Enter "sc stop MongoDB" (without the quotes) and press **Enter**.

```
C:\Users\Administrator>sc stop MongoDB
SERVICE_NAME: MongoDB
        TYPE               : 10  WIN32_OWN_PROCESS
        STATE                : 3   STOP_PENDING
                                (NOT_STOPPABLE, NOT_PAUSABLE, IGNORES_SHUTDOWN)
        WIN32_EXIT_CODE       : 0   (0x0)
        SERVICE_EXIT_CODE   : 0   (0x0)
        CHECKPOINT           : 0x2
        WAIT_HINT            : 0x7530
```

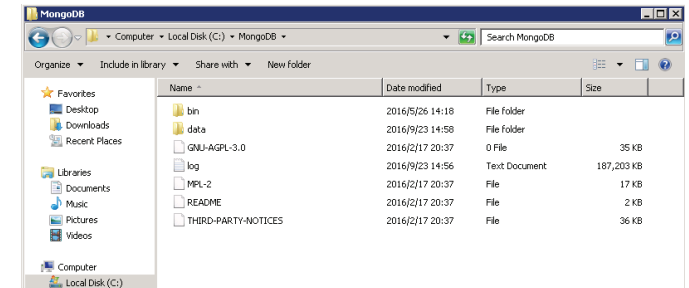

3. Enter "sc delete MongoDB" and press **Enter**.

```
C:\Users\Administrator>sc delete MongoDB
[SC] DeleteService SUCCESS
```

4. Go to: **Start > Control Panel > Programs and Features**, choose the MongoDB installation package and press **Uninstall**. Agree to the dialog box that is presented, asking if you want to uninstall MongoDB.

5. If you wish to uninstall the logs and data, go to the MongoDB installation folder and delete the **log** text file and **data** folder.

Appendix E

Migrating and Deactivating D-View 7

Introduction

Migrating and deactivating D-View 7 may be required if D-View 7 needs to be moved to another server.

If remote probes are in use, it may be necessary to re-install D-View 7 on a host with the same IP address, in order to avoid re-installing the probe software on each of the remote probes.

The instructions refer to the old server (the D-View 7 being migrated from) and the new server (the D-View 7 server being migrated to). The old server has a licensed, working copy of D-View 7 on it, and the new server is a clean install of the Operating System and has no version of D-View 7 on it.

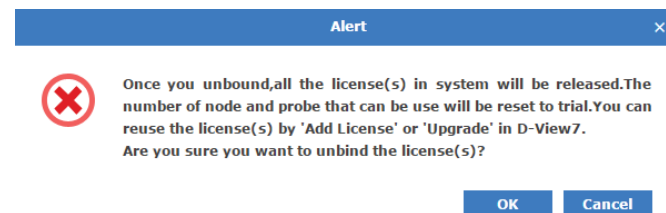

System Requirements

These instructions are for D-View 7 version 1.2.1.0.

Please see **System Requirements** on page 9 for more information on the system requirements for D-View 7.

Migration and Deactivation Procedure

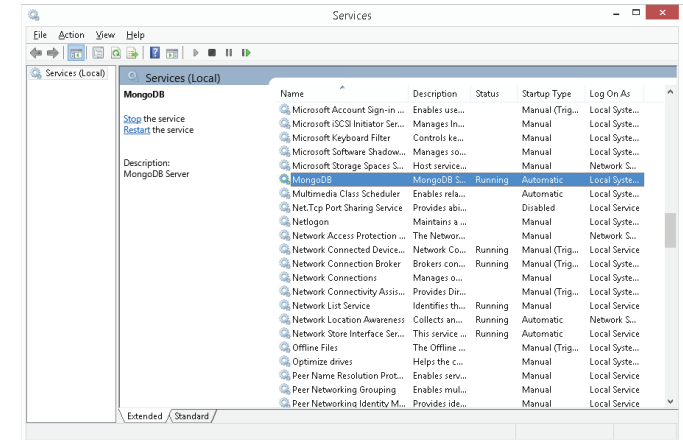

1. In D-View 7 on the old server, go to: **System > License** and click **Unbind Licence**. Press **OK** when asked if you are sure you want to unbind the licenses. This will return D-View 7 to a trial version. See **License** on page 96 for more information on the License page.

- On the old server, go to: **Start > All Programs > Accessories > Command Prompt**. Change directory to the folder that MongoDB is installed in and run `mongo.exe` to try to connect to the database:

```
cd D:\MongoDB\bin
mongo.exe
```

If there are any problems connecting to the database, ensure MongoDB is started by using the Windows Services manager.

- If the database is running, type "**use admin**" to switch to the admin database.

```
C:\bin>mongo.exe
MongoDB shell version: 2.6.5
connecting to: test
> use admin
switched to db admin
>
```

- Type "**show users**" to check whether you are authorized to use the admin database. If you get an "Error: not authorized message", enter the following to log-in as the admin user:

```
db.auth('admin','admin')
```

A result of "1" indicates that the command was successful.

```
> db.auth('admin','admin')
1
>
```

- Enter "**use DView7**" to switch to the DView7 database.

6. Enter the following to create a new user to perform the database backup:

```
db.createUser({
  user:"dview",
  pwd:"dview",
  roles:[{
    role:"readWrite",
    db:"DView7"
  }]
})
```

7. Exit the database session by typing "exit".
8. Run the following command at the Windows command line, substituting your own values for the ones below:

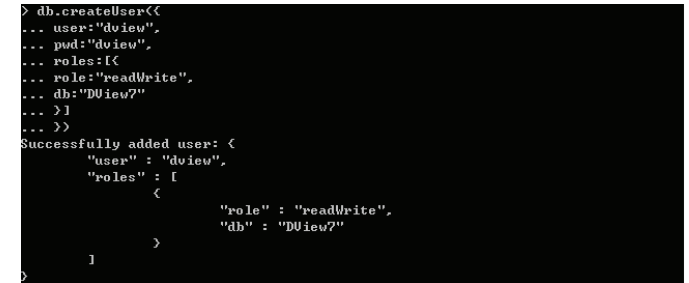

mongodump.exe -h host -d dbName -o dir -u user -p pwd

The values are:

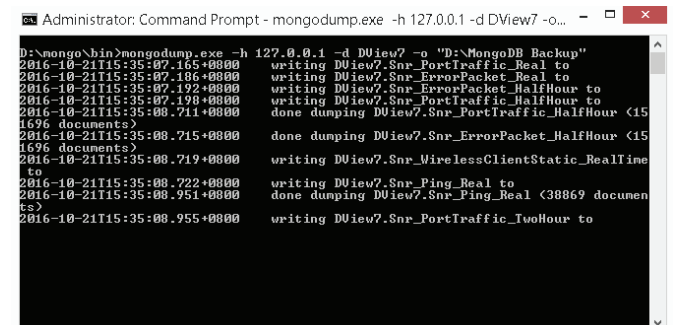

- h: The MongoDB host IP address, e.g.: 127.0.0.1
- d: The database instance which is to be backed up, e.g. DView7
- o: The path of the database backup. It should be created before the backup operation and should be different to the MongoDB installation path.
- u: The username of the database user created earlier
- p: The password of the database user created earlier

For example:

mongodump.exe -h 127.0.0.1 -d DView7 -o "D:\MongoDB backup" -u dview -p dview

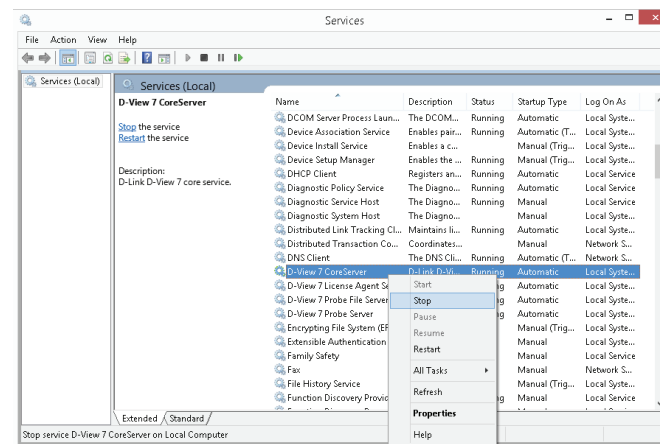

```
> db.createUser({
... user:"dview",
... pwd:"dview",
... roles:[{
... role:"readWrite",
... db:"DView7"
... }]
... })
Successfully added user: {
  "user" : "dview",
  "roles" : [
    {
      "role" : "readWrite",
      "db" : "DView7"
    }
  ]
}
```

```
Administrator: Command Prompt - mongodump.exe -h 127.0.0.1 -d DView7 -o...
D:\mongo\bin>mongodump.exe -h 127.0.0.1 -d DView7 -o "D:\MongoDB Backup"
2016-10-21T15:35:07.165+0800 writing DView7.Snr_PortTraffic_Real to

2016-10-21T15:35:08.715+0800 done dumping DView7.Snr_ErrorPacket_HalfHour <15
1696 documents>
2016-10-21T15:35:08.719+0800 writing DView7.Snr_WirelessClientStatic_RealTime
to
2016-10-21T15:35:08.722+0800 writing DView7.Snr_Ping_Real to
2016-10-21T15:35:08.951+0800 done dumping DView7.Snr_Ping_Real <38869 documen
ts>
2016-10-21T15:35:08.955+0800 writing DView7.Snr_PortTraffic_TwoHour to
```

9. Install D-View 7 on the new server. Once complete, if migrating to a new server with the same IP address, it may be necessary to deactivate the old server. This can be done by taking the old server offline or stopping the **D-View 7 Core Server** service.

10. On the new D-View 7 server, perform the steps above to create the "**dview**" user.
 11. Run the following command at the Windows command line, substituting your own values for the ones below:

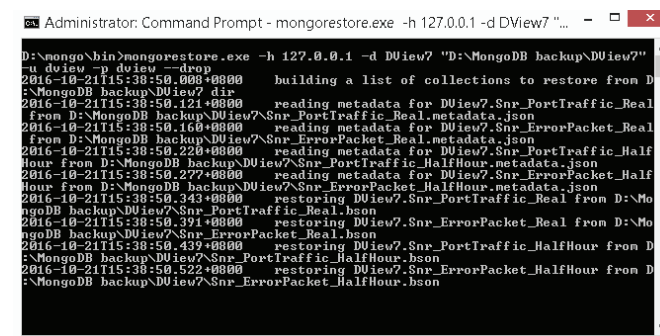

mongorestore.exe -h host -d dbName -o dir -u user -p pwd -drop

The values are:

- h: The MongoDB host IP address, e.g.: 127.0.0.1
- d: The database instance which is to be backed up, e.g. DView7
- o: The path of the database backup. Add the "DView7" folder to the original backup path to provide the full path to the backup made earlier
- u: The username of the database user created earlier
- p: The password of the database user created earlier
- drop: Drop the existing database so that the restore can be performed

For example:

mongorestore.exe -h 127.0.0.1 -d DView7 -o "D:\MongoDB backup\DView7" -u dview -p dview -drop

12. In D-View 7 on the new server, go to: **System > License > Add License** and upload the license previously removed from the old server. See **License** on page 96 for more information on the License page.

Once the process is complete, ensure that the previous version of D-View 7 on the old server remains deactivated.

Device Details Logs

Devices that have support for local or remote logging will have a logs tab, which list all of the events for that device. D-View 7 supports both the Trap and Syslog standards and can receive either if a remote networking device is configured properly.

The Logs view can be filtered by time period using the drop down menu. The events are listed in chronological order, starting with the name of the event, the SNMP version that was used by the remote device, the category of event for the message, and the message itself.

Devices that have notifications setup correctly will also have their events added to the D-View tool panel event notification area. These alerts are for all devices setup correctly and clicking on either **Critical**, **Warning**, **Informative**, **System**, or **Unmanaged** will allow the administrator to review and take action as necessary.

To configure a device to use D-View 7 as a Trap or Syslog server, click on the **Settings** tab and refer to **Device Details Settings** on page 71.
